one, still leaves him his self-control. The secondary mean-
ings of the two words keep this difference.

(b) A mixture of flour and water boiled and sometimes strengthened by the addition of starch, and often preserved from moulding by some added substance, used as a cement in various trades, as in bookbinding, leather-manufacture, shoemaking, etc. (c) In *calico-printing*, a composition of flour, water, starch, and other ingredients, used as a vehicle for mordant, color, etc. (d) In *ceram.*, clay kneaded up with water, and with the addition, in some cases, of other ingredients, of which mixture the body of a vessel or other object of earthenware is made. The paste of common pottery is either hard or soft. The hard is that which, after firing, cannot be scratched by knife or file. In porcelain the difference is more radical, the paste of soft-paste porcelain not being strictly a ceramic production. (See *soft-paste*, *hard-paste*, and *porcelain*.) The epithets *hard* and *soft* have reference to the power of resisting heat, hard-paste porcelain supporting and requiring a much higher temperature than the other. The paste of stoneware is mingled with a vitrifiable substance, so that after being fired it is no longer porous, whereas the paste of common pottery absorbs water freely. (e) In *plastering*, a mixture of gypsum and water. (f) In *soap-manuf.*, a preliminary or crude combination of fat and lye.

For the *paste* operation, no leys should be used containing foreign salts.

Pasteur's method in hydrophobia consists, essentially, in progressive inoculation with less and less attenuated virus until the use of that of a high degree of intensity is attained. The virus, in its different degrees of virulence, is obtained from the spinal cord of rabid rabbits which have acquired the maximum intensity of the disease after a repeated transference of the virus from one animal to another. Sections of the cord free from foreign germs are allowed to remain, for different periods of time, in a sterilized and dry atmosphere, whereby the virulence of the virus becomes progressively diminished, until it is finally completely lost.

=*Syn. Pastime, Amusement, Recreation, Diversion, Entertainment, play.* The italicized words keep near to their that by derivation. The central idea of a *pastime* is that it is so positively agreeable that it lets time slip by unnoticed: as, to turn work into *pastime*. Amusement has the double meaning of being kept from ennui and of finding occasion of mirth (see *amuse*). Recreation is that sort of play or agreeable occupation which refreshes the tired person, making him as good as new. Diversion is the stronger word than recreation, representing that which turns one aside from ordinary serious work or thought, and amuses him greatly. Entertainment has come to have great breadth, ranging from amusement in its narrower sense to diversion and to the idea of a set exercise, as a concert, or to the articles of food furnished to guests; generally, however, *entertainment* stands for that which is social and refined.

2. A minister or clergyman installed according to the usages of some Christian denomination in charge of a specific church or body of churches. The word is often used to denote a clergyman considered with reference to his care of his people, as in visiting the sick, etc., rather than with reference to his office as preacher. The term *shepherd* (Latin *pastor*) is applied in the New Testament to Christ (John x. 11; 1 Pet. ii. 25); thence it was transferred to the bishops and other clergy generally of the Christian church; in later usage it is ordinarily confined to a minister ordained over a local church.

Except in the bats the patagium does not form a wing, and the progress of the animal through the air is not a true flight, but only a greatly protracted leap. In bats the membranous expansion is stretched chiefly between the enormously lengthened digits of the hand; in the case of the other mammals named, the patagium is for the most part a fold of the common integument of the body, stretched from the fore to the hind limb. The patagia of the pterodactyls or extinct flying reptiles were wings, constructed upon lengthened digits, much like those of bats. The case is different with the flying lizards of the present day, in which the patagium is stretched upon extended ribs. See *cut* at *dragon*. Also called *parachute*. (b) The fold of integument which occupies the reentrant angle between the upper arm and the forearm of a bird, bringing the fore border of the wing to a smooth straightish free edge when the wing is closed. (b) The grant by a government to the author of a new and useful invention, or to his assigns, of the exclusive right of exploiting that invention for a specified term of years; also, the instrument or letters by which a grant of land is made by a government to a person or corporation. By the United States Revised Statutes, sec. 4886, etc., any person, whether a citizen or an alien, may obtain patent protection for the term of seventeen years "who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned." The fact that the invention has been first patented in a foreign country will not debar the inventor from obtaining a valid patent in the United States, unless the same has been here "introduced into public use for more than two years prior to the application." But the patent will expire with that foreign patent having the shortest term. In the application of the several clauses of this statute, distinctions arise of difficult and delicate character, which are the constant subject of controversy. For the United Kingdom of Great Britain and Ireland and the Isle of Man, patents are granted (under 46 and 47 Vict. c. 57, 1883) to any person, whether British subject or not. The general principles as to what constitutes an invention or improvement are substantially the same as above stated. For each of the principal British colonies there is a separate statute.

=Syn. 1. *Patience*, *Fortitude*, *Endurance*, *Resignation*. *Patience* is by derivation a virtue of suffering, but it is also equally an active virtue, as *patience* in industry, application, teaching. Passively, it is gentle, serene, self-possessed, without yielding its ground or repining; actively, it adds to so much of this spirit as may be appropriate to the situation a steady, watchful, untiring industry and faithfulness. *Fortitude* is the passive kind of *patience*, joined with notable courage. In *endurance* attention is directed to the fact of bearing labor, pain, contumely, etc., without direct implication as to the moral qualities required or shown. *Resignation* implies the voluntary submission of the will to a personal cause of affliction or loss; it is a high word, generally looking up to God as the controller of human life. *Resignation* is thus generally a submission or meekness, giving up or resigning personal desires to the will of God.

patina (pat'i-nā), *n.* [< L. *patina*, *patena*, a broad shallow dish, a pan: see *paten*¹, *pan*¹.]

1. A bowl; a patella.—2. (a) An incrustation which forms on bronze after a certain amount of exposure to the weather, or after burial beneath the ground. It is, when perfectly developed, of a dark-green color, and has nearly the composition of the mineral malachite (hydrated carbonate of copper). Such an incrustation, although very thin, is considered to add greatly to the beauty of an antique object, especially of a bust or statue, and is of importance as protecting it from further oxidation. Artificial and evanescent patinas are produced by forgers of antiquities by the application of heat or acids, and in various other ways. Some modern bronzes acquire a dark-colored patina, which is a disfigurement rather than an ornament. Elaborate investigation on the part of various chemists has failed to explain this ill-colored patina very satisfactorily. It is believed, however, that coal-smoke in large cities may be a cause of its formation, as under such circumstances it contains particles of carbonaceous matter; and also, that the present almost universal practice of patting considered the zinc into the bronze, to facilitate its casting, is one of the causes of this defect. The dark color of the patina of Japanese bronze has been shown, in a considerable number of cases at least, to be in all probability due to the presence of lead in the alloy. Also *patina*. (b) By extension, the surface-texture or -color which other works of decorative art, as a wooden cabinet or the like, gain through the action of time. (c) The surface, produced partly by accretion, partly by discoloration and the effects of acid in the soil, given to marble by long inhumation.—3. [cap.] [NL.] In *conch*, a genus of gastropods. J. The public rights of the child, however, remained intact, as that of voting and that of holding a magistracy.

Hence—2. In subsequent Jewish history, one of the heads of the Sanhedrim after the destruction of Jerusalem and the dispersion, the patriarch of the Western Jews residing in Palestine, that of the Eastern in Babylon.—3. In the early church, and in the Orthodox Greek and other Oriental churches, a bishop of the highest rank; in the Roman Catholic Church, a bishop of the highest rank next after the Pope. In the early church the highest dignity, which came in time to be designated as that of patriarch, belonged from time immemorial, and as was believed from apostolic days, to the bishops of Rome, Alexandria, and Antioch—these three sees ranking as to dignity, precedence, and privileges in the order named. The Council of Constantinople (A. D. 381) gave the bishop of that see prerogatives of rank next after Rome, and the Council of Chalcedon (451) confirmed this, decreeing that this canon conferred an equality of prerogatives with Rome, still leaving the latter see, however, a higher rank. Since that time Constantinople has always stood at the head of the orthodox Oriental sees, and since the sixth century its bishop has borne the title of *ecumenical patriarch*. The patriarchal dignity of Jerusalem was not recognized till the Council of Chalcedon. Constantinople, Alexandria, Antioch, and Jerusalem still remain the four great patriarchates of the orthodox Eastern Church. In 1582 Moscow was made a patriarchate, ranking next after these, but since 1721 the place of patriarch of Moscow has been represented by the Holy Governing Synod. Besides the orthodox Oriental patriarchs there are others, representing the Armenian, Jacobite, Coptic, and other Oriental churches, and also Latin or Roman Catholic titular patriarchs of the same sees. In the Roman Catholic Church the Pope is regarded as having in his papal capacity a rank superior to his rank as patriarch, and the cardinals also take precedence of patriarchs. There are also three minor patriarchs in the Roman Catholic Church—of the Indies, of Lisbon, and of Venice. The title of patriarch seems to have first come into use in the Christian church in imitation of a similar title given to the head of a Jewish patria, or group of communities. In general usage it was apparently first given, without definite limitation, to senior bishops or bishops of special eminence. The bishops of the greater patriarchal sees were at first called archbishops, in the older sense of that title. From the fourth century the title of patriarch came to be

commonly applied to the bishops of the patriarchal sees, and is so used in imperial laws of the sixth century. It was not, however, till the ninth century that it became strictly limited to these. Exarchs, metropolitans, and archbishops rank next after patriarchs. See *catholicos*.

The Primate of all England was also Patriarch of all the British islands. *E. A. Freeman, Norman Conquest, V. 153.*

In correctness of speech, we are assured by Theodore Balsamon, the Patriarch of Antioch is the only Prelate who has a claim to that title—the proper appellation of the Bishops of Rome and Alexandria being Pope; of Constantinople and Jerusalem, Archbishop.

10. In *gun-making*, the distribution of shot in a target at which a shot-gun is fired. In a circle called the "killing-circle" by sportsmen and gun-makers (which at a range of 40 yards is from 26 to 30 inches in diameter), the shot should be evenly distributed, so that there can be no possibility of escape for game within the periphery of this circle. The more uniform the distribution of the shot the better is the pattern. The number of shot in the pattern varies widely, according to the size of the shot, which is selected in accordance with the kind of game sought. To secure the desired pattern it is sometimes necessary to re-bore the barrel of a gun several times. — *Dambrod*, *barl*, *hawthorn*, *onion*, *pomegranate*, etc., *pattern*. See the qualifying words. — *Declared pattern*, the number of pellets of a given size, which, with a given weight of the shot and a given weight of a specified kind of powder, a shot-gun is stated by the maker to be able to deliver and distribute in a "killing-circle" of a stated diameter at a prescribed range, and with a good degree of uniformity in the distribution. See def. 10. — *Syn*. *L. Model*, *Ideal*, etc. See *example*.

See *pattern-chain* and *pattern-cylinder*. Also called *shuttle-box*. (b) The box perforated to accord with the harness-cards of a Jacquard loom. Also called *prism* or *cylinder*.

pattern-card (pat'érn-kârd), *n.* 1. (a) A piece of cardboard to which a sample or specimen of cloth, velvet, or the like is attached. Hence—(b) A number of such pieces of cardboard, forming a sort of book, or folding alternately so as to open out in a long strip and exhibit, at one time, a number of patterns of stuff. — 2. In *weaving*, one of the perforated pieces of cardboard used in the Jacquard attachment to a loom. The cards are joined together in a flexible endless chain, and pass over the pattern-box, each in turn controlling the harness-system. Whenever a hole in a card and one in the box coincide, the corresponding rod connected with a warp-thread enters the hole and its warp-thread is raised. See *loom*.

pattern-chain (pat'érn-chân), *n.* In *weaving*, a device for automatically bringing the shuttles to the picker, according to the sequence required by the pattern. In one form, in the shuttle-boxes at the ends of the race, the links of the chain

pattern-cylinder (pat'érn-sil'ín-dér), *n.* In *weaving*, a cylinder, or in some forms of loom a wheel, with projections so arranged on its periphery that its movement shall control the harness-system and the pattern-boxes, and thus fix the pattern of the woven fabric. Also called *pattern-wheel*.

pattern-maker (pat'érn-má'kér), *n.* In *mech. engin.*, a workman who makes the patterns used by molders in foundry-work. These patterns are usually made, in the first instance, of pine or mahogany, the pattern-maker working from drawings. If the patterns are to be much used, they are frequently duplicated in metal, the pattern after casting being filed and scoured smooth, then warmed, and coated with wax. Metal patterns have the advantage of not warping like wood patterns. Patterns are also sometimes made of plaster of Paris swept by templates while in a plastic state. This method has been successfully applied in architectural ironwork in the production of cornices and analogous forms. Pattern-making is a distinct trade, requiring great skill in wood-working, combining as it does the finest joinery-work with the art of wood-carving and the ability to read and interpret the most complicated mechanical drawings.

Specifically, the elaborate defense introduced about 1400, consisting of splints, sliding one over the other, or of a single piece so formed and secured by pivots that, as the arm was raised, it moved toward the neck, falling again by its own weight as the arm was lowered.

The pauldron of the right shoulder was usually smaller than that of the left, to allow of freer movement of the sword-arm, and especially for passing the lance under the armpit when couched. The pauldron of the close of the fifteenth century forms an inseparable part of the articulated and elaborated suit of plate-armor. See *epaulet*.

Application of payments, appropriation of payments, the determining which of several obligations shall be extinguished or reduced, when a payment not sufficient to extinguish all is made. Thus, if a debtor owing to the same creditor an open account, a bond, and a note secured by mortgage on the debtor's property pays a sum sufficient to satisfy only one, it is for his interest that it be applied to the mortgage, so as to free his property from incumbrance; and it is for his creditor's interest that it be applied to the open account, which is unsecured, and will be outlawed before the bond. pea¹ (pē), *n.* [A mod. form, assumed as sing. of the supposed plural *pease*: see *pease*¹.] The plural of *pea* is *peas*, as 'as like as two peas,' 'a bushel of peas,' with ref. to the individual seeds, as in 'a bushel of beans'; but when used collectively the old singular *pease* is properly used, as 'a bushel of *pease*,' like 'a bushel of wheat or corn.' 1. The seed of an annual hardy leguminous vine, *Pisum sativum*; also, the vine itself. The pea is marked by its climbing habit and glaucous surface, its pinnate leaves ending in a branching tendrils, its large stipules, and its large, commonly white, papilionaceous flowers, followed by pendulous pods containing sweet nutritious seeds. The original form, *P. sativum*, var. *arvense* (*P. arvense*), the common gray pea or field-pea, is thought by some to be native in Greece and the Levant, by others to have come from further north. Peas were known to the ancient Greeks and Romans, and their cultivation is now general. Usually only the seeds are edible, but the pods of the sugar-pea, skinless pea, or string-pea are eaten, as in the case of "string-beans." The seeds are now mostly consumed when green, but are also split when ripe, and used in soups or ground into meal. [See *pease-meal*.] Before the spread of the potato, peas formed in England a principal food of the working classes. The varieties are very numerous, those of the marrow class being distinguished by seeds which are wrinkled and greenish even when ripe.

Yes, yes, Madam, I am as like the Duc de Richelieu as two peas; but then they are two old withered grey peas. *Walpole*, *Letters*, Oct. 13, 1765.

See def. 2.—2. A garden and orchard tree, *Prunus (Amygdalus) Persica*. The peach is a rather weak irregular tree, 15 or 20 feet high, with shining lanceolate leaves, and pink flowers (see cut under *calyciflorate*) appearing before the leaves. The roundish or elliptical fruit is 2 or 3 inches in diameter, and covered with down; when ripe, the color is whitish or yellow, beautifully flushed with red; its flesh is subacid, luscious, and wholesome. The peach is closely allied to the almond, from which Darwin inclines to derive it. Its local origin has commonly been ascribed to Persia, but the investigations of De Candolle point to China. It is now widely cultivated in warm-temperate climates, most successfully in China and the United States, as in Delaware, on the shores of the Chesapeake and Lake Michigan, and in California. (See cut, 4, *peach-blight*, and *peach-yellow*.) The canning of peaches is now a large local industry; large quantities also are dried, and some are made into peach-brandy. The seeds often take the place of bitter almonds as a source of oil, etc. Peach-leaves and -flowers are laxative and anemimetic. The varieties of the peach are numberless, a general distinction lying between clingstones and free-stones (see these words), and again between the white and the yellow-fleshed. (See *nectarine*.) The flat peach or peento is a fancy Chinese variety, having the fruit so compressed that only the skin covers the ends of the stone. Another Chinese variety, the crooked peach, has the fruit long and bent, and remarkably sweet. In ornamental use there is a weeping peach; and various dwarf and double-flowered varieties, called *flowering peaches*, have been produced with pure-white or variously of very brilliantly colored flowers.—**Guinea peach**, a climbing shrub, *Sarcocophalus esculentus*, of tropical western Africa, bearing heads of small pink flowers, and a pulpy collective fruit which is eaten by the natives. In the first year the disease usually causes only a more or less premature ripening of the fruit; in the second year it is more marked, the whole tree having a sickly languishing appearance, with the entire foliage dwarfed and rolled or curled up, and yellowish or brownish-red (whence the name) in color. The diseased trees rarely dies in the second year of attack, and rarely lives beyond the fourth or fifth year. Little or no valuable fruit is produced after the second year. 2. The tree *Pyrus communis*. The wild tree is common over temperate Europe and Asia, often scrubby, but under favorable conditions becoming, as under culture, a handsome tree of good height, inclining to a pyramidal form. Though close to the apple botanically, it differs in its more upright habit, smooth shining leaves, pure-white flowers with purple stamens, the granular texture of the wild fruit, the juicy melting quality of the fine varieties, and the form of the pome, which tapers toward the base and has no depression around the stem. The tree is long-lived, specimens existing which are two or three hundred years old. The pear was known in a number of varieties in the days of Pliny, but its excellence of much later date. In recent times it has received great attention, its culture being pushed with special zeal in France. It is a highly successful fruit in the United States. The varieties of pear are numbered by thousands, but only a few are really important. The Seckel is an American variety—the fruit small, but unsurpassed in quality. The Bartlett, known in Europe, where it originated, as *Williams's bon Chrétien*, is also universally popular. Pomologists place some others, as the *beurre d'Angou*, as high as these or higher. Dwarf pears (that is, those grafted or budded on quince-stocks) are more convenient for gardens: standard pears (that is, those grafted or budded on seedling-pear stocks) are commonly more profitable. In some regions, as England and northern France, a liquor is made from the juice of the fruit. (See *perry*.) Pear-wood has a compact fine grain, and is highly prized for cabinet- and mill-work, etc., and second only to boxwood for wood-engraving and turnery.

Sp. *perla* = Pg. *perola*, *perla* = It. *perla*; < early ML. *perula*, *perulus*, *perla*, a pearl, prob. var. of *pirula*, a little pear, dim. of L. *pirum*, a pear; see *pearl*. Cf. Sp. *perilla*, a little pear, a pear-shaped ornament, Olt. *perolo*, a little button or tassel (Florio). Cf. *purle*.² 1. A nacreous concretion, or separate mass of naure, of hard, smooth, lustrous texture, and a rounded, oval, pear-shaped, or irregular figure, secreted within the shells of various bivalve mollusks as a result of the irritation caused by the presence of some foreign body, as a grain of sand, within the mantle-lobes. The formation of a pearl is an abnormal or morbid process, comparable to that by which any foreign body, as a bullet, may become encysted in animal tissues and so cease to cause further irritation. In the case of the mollusks which yield pearls, the deposition is of the same substance as the naure which lines the shell, hence called *mother-of-pearl*, in successive layers upon the offending particle. Fine pearls have frequently been found in working the mother-of-pearl shell. Chemically, pearls consist of calcium carbonate interstratified with animal substance, and are hence easily dissolved by acids or destroyed by heat. The chief sources of the supply of pearls are the pearl-oysters and pearl-mussels, *Avicula* and *Unio*idae, and foremost among the former is the pearl-oyster of Indian seas, *Melagrina margaritifera*. Pearls are generally of a satiny, silvery, or bluish-white color, but may be of various colors, purple, yellow, gray, smoky-brown, and black. The finest white pearls are from Ceylon, the Persian Gulf, Thursday Island, and the western coast of Australia. The yellow are from Panama. The finest black and gray pearls are obtained in the Gulf of California, along the entire coast from Lower California to the lower part of Mexico. There are two distinct varieties of pink pearls: those from the common conch-shell, *Strombus gigas*, of the West Indies, and those from the unios or fresh mussels found in Scotland, Germany, France, and the United States (the finest being obtained principally from Ohio, Tennessee, Kentucky, Texas, and Wisconsin), also from the small marine shell *Trigona pedemontana* of Australia. Purple, light-blue, and black pearls are found in the common clam, *Venus mercenaria*. The yellow color of Oriental pearls generally results from the decomposition of the mollusks in which they are found. The value of a pearl depends entirely on its perfection of form (which must be either round, pear-shaped, or a perfect oval), on its luster or "orient," and on the purity of its color, a tint of yellow or gray detracting very much from the value. Pearls are sold by the pearl-grain, four grains equalling one carat. (See *carat*, n., 4.) From 1880 to 1890 the demand for pearls and the rarity of their occurrence resulted in an advance in price of from \$50 to 300 per cent., the larger pearls having advanced more proportionally than the smaller ones. Until about 1895, pearls were generally valued as multiples of a grain. The value of a pearl larger than one grain was estimated by squaring its weight and multiplying this by the value of a one-grain pearl; thus, a two-grain and a five-grain pearl were worth respectively 4 and 25 times the value of a one-grain pearl.

A man should not finde nowhere more true;
Precious rich were, of huge medicine.
Rom. of Parthenay (E. E. T. S.), I. 4566.

Eng.]—11. *Eccles.*, a name sometimes given to a particle of the consecrated wafer: still current in the Oriental Church.—12. A name given by gilders and manufacturers of jewelry to granules of metal produced by melting it to extreme fluidity, and then pouring it into cold water. The stream in pouring should be so small, and the crucible held at such a distance from the water, that the metal will break up into fine drops (pearls) before reaching the water, which instantly cools them. The cooled granules are usually pear-shaped. The epithet *granulated* is more commonly applied in the United States to metals prepared in this way, as granulated copper, silver, zinc, etc., used in the preparation of jewelers' alloys on account of their convenience in weighing, and for other purposes—pure granulated zinc being much employed by chemists for generating pure hydrogen gas, as in Marsh's test for arsenic, etc.

13. In *lace- and ribbon-making*, one of the loops which form the outer edge. Also *perl*.—14. In *decorative art*. See *perl*.—Baroque *perl*. See *baroque*.—Blind pearls, irregular, lusterless, and valueless pearls, used for medicinal purposes in the East.—Epithelial pearls, small spheroidal masses of flattened epithelial scales, sometimes arranged in a circle, occurring in epitheliomata. Also called *bird's-nest bodies* and *epidermic spheres*.—Half pearls, pieces cut from pearls that are very irregular and have only one lustrous side or corner, which is slit off. They are extensively used in jewelry, and are much less expensive than whole pearls, but are very liable to become discolored if wet, as the layers of the pearl, being cut across, absorb the water, and any impurities it may contain show through the layers.—Imitation, artificial, or false pearls are of two kinds, solid or massive pearls and blown pearls. (See *Lemaire pearl* and *Roman pearl*.) The first are known as *Venetian pearls*, and are manufactured chiefly on the island of Murano, near Venice. They are made from small white or colored glass tubes, the desired hues being produced by the use of oxid of tin and other metals. Blown pearls consist of small globules of thin glass, coated on the inside with the so-called oriental-pearl essence, or essence d'orient. Their manufacture is attributed to Janin or Jaquin, who lived in Paris about 1680, and who was the first to line hollow glass balls with this mixture, which he prepared with the scales of a small fish, the bleak, common in France and Germany, and mutilage. The mixture was first suggested by his observing the brilliant luster of the scales that were detached from the fish when they rubbed against one another in a trough. The scales of 18,000 fish are required to make one pound of oriental-pearl essence.—Inner pearl, in *lace-making*, ornamental loops worked around the edge of an opening in lace, as distinguished from *perl*, which is a loop on the outer edge.—Large pearl, in *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, these may be separated to the greatest extent without breaking the connecting thread of syrup. In this condition the sugar forms a large drop, or "pearl." If suspended from a rod.—Lemaire pearl, an imitation pearl composed of a solid glass ball externally coated with a varnish composed of oriental-pearl essence, white wax, alabaster, and parchment glue. A. Costellani, Gems.—Little pearl, in *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, the finger and thumb may be separated to nearly the full extent without breaking the thread of syrup. Large quantities are used in the East for medicinal purposes, in the composition of electuaries supposed to possess stimulating and restorative qualities.—Small pearl. Same as *little pearl*.—Smoked pearl, mother-of-pearl, or very dark or very dark pearls, or cloudings.—Virgin pearls, unperled pearls of fine quality.

A peasant may or may not be the proprietor of the land which he cultivates; in Great Britain he is distinguished from a *farmer* as having less property, education, or culture, or inferior social position; but the word is very vague. The French peasant (*paysan*) and the German peasant (*Bauer*) were until recently greatly restricted in their civil and political rights. The word is not used in the United States, where there is no comparatively stable body of agricultural laborers corresponding to the European peasantry.

Partly decomposed vegetable matter, produced under various conditions of climate and topography, and of considerable importance in certain regions as fuel. Peat occurs in many countries and in different latitudes, but always either in swampy localities or in damp and foggy regions. It is formed of vegetable matter undergoing decay, and in some respects it is the modern representative of the coal of the earlier geological epochs, and its formation illustrates the conditions under which coal has originated. Peat is abundant in northern Europe, and particularly so in Ireland, where it is perhaps of greater importance as fuel than in any other country. It occurs in India, especially in the Neilgherry hills and in Bengal; also in various parts of the United States, and there are in the latter country regions (especially in New England) where it is occasionally used as fuel. The vegetation of which peat is made up in the various countries where it occurs is quite different, and occasionally the number of species which have taken part in its formation is large. The genus *Sphagnum* is an important element in much of the European peat. The peat of Bengal, on the other hand, is said to be formed almost exclusively from one plant, the wild rice, *Oryza sylvestris*. The peat of New England is made up of a considerable variety of aquatic plants. Peat is very spongy, and contains a large amount of water near the surface; the deeper down it is taken, the more compact it is. A great variety of processes for compressing and hot-drying it have been invented and put in use in different parts of the world. 2. A small block of peat-bog or -moss, resembling an ordinary brick in shape, cut and dried for fuel.

There other with these spades the *peats* are squaring out.

Peat-charcoal has been much experimented with, and used in metallurgical operations to some extent for fully three hundred years. The carbonization of ordinary air-dried peat produces a very friable charcoal, and the denser the peat is made, by compression or in other ways, the better the article produced.

In France *peat-charcoal*, under the name of *Charbon roux*, is much used for making gunpowder. *Ure, Dict., III. 627.*

or by admixture of other substances, as coal-dust, tar, etc. These machines are, in general, grinders and pressers, which pulp the material in order to render it homogeneous, and then compress it into blocks of convenient form.

peat-moor (pét'môr), n. Same as *peat-moss*. In the United States such deposits are called *swamps* or *bogs*. See *peat*¹ and *peat-moss*.

Peat is very largely dug in the moorlands of Somersetshire, near Edington and Shapwick, between Glastonbury and Highbriard. Some of these beds have been worked for centuries from the time of the Romans, and probably earlier, while others are of more recent formation. The *peat moors* or "turbary lands" have an irregular distribution; and the peat, which in places is 14 or 15 feet thick, is due largely to the growth of the common sedge (*Carex*), whence *Sedgemoor* derives its name.

pea-weevil (pé'wé'vil), n. A kind of curculio, *Bruchus pisi*, which infests peas. It is an indigenous North American insect, which probably fed on some other legume before the cultivated pea was introduced; it has spread to Europe, and is now found in Great Britain and along the Mediterranean. The egg is laid on the outside of the pod, and the newly hatched larva burrows into the nearest pea, in which it feeds and grows to full size. Before transforming to the pupa it provides for its exit by cutting a round hole through all but the outer membrane of the pea. The beetle does not issue until the following spring. See *Bruchus*. Also called *pea-beetle*, *pea-bug*, and *pea-chaffer*.

A small rounded stone. The term is usually applied to stones worn and rounded by the action of water. Pebbles are less in size than cobbles; and ordinary gravels are chiefly made up of sand, the grains of which pass by imperceptible gradations of size into pebbles, with which are frequently intermixed more or less of rounded fragments large enough to be called cobbles.

The term is properly restricted to the act of producing an irregular pattern, such as would be produced by pressing irregularly distributed minute pebbles upon the leather; whence the name. A pattern consisting of straight or approximately straight lines is called a *straight-grained pattern*, and the leather would be called *straight-grained*. The term *graining* includes pebbling, which is but a special kind of graining, of which glassing or glazing is still another variety.

pebbling-machine (peb'ling-ma-shēn'), *n.* In *leather-manuf.*, a machine resembling a polishing-machine in its construction, used to perform the special work called pebbling. The pebbling is done by a roller having on its surface the pattern, in reverse, which it is desired to impart to the grain of the leather. The roller is pivoted to elastic bearings at the lower end of a swinging arm, and is antagonized by a table curved to correspond to the arc through which the roller acts. The leather is supported by the table while subjected to the action of the roller. The imparting of a pattern in imitation of more costly leather is strictly a variety of graining, though often called *pebbling*. Since the machine used for glassing, glazing, or polishing is transformed into a pebbling-machine by a change in the roller only, the machine is variously and indifferently called *polishing*, *glassing*, *graining*, or *pebbling-machine*.

Inside, the body is filled with minute ovoid corpuscles (*Microsporidies*) upon the presence and multiplication of which the disease depends. Pebrine is both contagious and infectious. The Pasteur system of selection consists in the microscopic examination of the moth after egg-laying, and the rejection of eggs laid by those found to be diseased. The microbe which causes pebrine was named by Lebert *Parasitophyton*, and classed among the perosperms.

Schimper has grouped the *Pecopterides* with regard to their relation to living ferns and with reference to the character of the fructification, in five subdivisions; but "one has only to look at the classification of a few species grouped from the apparent character of the fructifications to see how unreliable are the diagnoses derived from them" (Lesquerre). The grouping of the *Pecopterides* suggested by the fossil botanist of the Pennsylvania Geological Survey is as follows: (1) including the species referred by Schimper to the genus *Goniatites*, distinguished by an upward curve of the lateral veins; (2) *Pecopteris* proper, or cyatheids, to which division belong the species answering exactly to Brongniart's definition of the genus *Pecopteris*; (3) *Pecopteris* with hairy or villous surfaces, a permanent and easily discernible character; (4) *Pecopteris* with pinnae not distinctly divided into obtuse entire lobes or pinnules, but generally cut on the borders in sharp irregular teeth; and (5) a group containing those species referred to *Pecopteris* which "do not find a place in the former divisions." Kidston (1886) divides the *Pecopterides* into two subdivisions, *Pecopteris* and *Dactylothea*;

the genus *Pecopteris* as limited by him includes species previously referred by fossil botanists to twenty-four different genera.

As distinguished by Brongniart, the genus *Pecopteris* has bipinnate or tripinnate fronds; the pinnae are long and pinnatifid; the pinnules adhere to the rachis by the whole base, and are often more or less deeply connate and not decurrent, and the borders are generally contiguous or nearly so; the secondary veins, which are derived from the median nerve of the pinnae, are simple, bifurcate, or trifurcate. pedagogy (pēd'ā-gō-jī), *n.* [Formerly also *pedagogy*; = *F. pédagogie* = *Sp. pedagogía* = *Pg. It. pedagogia*, < *Gr. παιδαγωγία*, the training or guiding of boys, education, < *παιδαγωγός*, a *pedagogue*; see *pedagogue*.] 1. The art of the *pedagogue*; the science of teaching; *pedagogics*.

The tendency to apply the exact methods of science to problems of education is one of the most hopeful signs of present *pedagogy*. *Science*, VI. 341.

2. Instruction; discipline.

He delivers us up to the *pedagogy* of the Divine judgments.
Jay Taylor, *Works* (ed. 1835), I. 826.

The Jews were a people infinitely delighted with pompous and busy superstition, and had ordinances accordingly whilst they remained under that childish *pedagogy*.
Evelyn, *True Religion*, II. 181.

There was a sacrifice for the whole congregation prescribed in the Mosaic *Pedagogy*.

pedal (pēd'al or pē'dāl), *a.* and *n.* [= *F. pédale*, *n.*, = *It. pedale*, < *L. pedalis*, pertaining to the foot, < *pes* (*ped*) = *E. foot*; see *foot*.] 1. *a.* 1. Pertaining to or connected with a foot or the feet: as, *pedal* extremities.—2. Technically—(a) Of or pertaining to a foot-like part of the body, as of a mollusk; podial: as, a *pedal* ganglion. (b) Of or pertaining to the pes or hind foot only: opposed to *manual*.—3. Pertaining to the feet of perpendiculars let fall from one point upon tangents to a fixed locus called a *basis*.

—4 (ped'al). In *music*, relating to a *pedal*.—**Pedal action**, the entire mechanism of pedals, in either a pianoforte, organ, or harp, including the pedals themselves, the connecting apparatus of rods, trackers, levers, etc., and their attachment to dampers, sliders, etc.—**Pedal adductor**, the posterior adductor muscle of bivalve mollusks, the anterior one being distinguished as *palial*. It is the only one in the *Monomyaria*, as oysters and scallops.—**Pedal aponeurosis**, the dorsal fascia of the foot.—**Pedal artery**, the dorsal artery of the foot.—**Pedal bass. See *organ-point*.—**Pedal board**. Same as *pedal keyboard*.—**Pedal check**, in *organ-building*, a device for preventing damage to a *pedal* keyboard when not in use. It consists of a spring which prevents the *pedal* keys from being depressed until it is moved. It is usually controlled by a stop-knob.—**Pedal coupler**, in *organ-building*, a coupler which connects one of the manual keyboards with the *pedal* keyboard, so that the latter affects the former.**

Usually each of the keyboards may be thus coupled to the pedals.—**Pedal curve** or *surface*, the locus of the feet of the perpendiculars let fall from one point upon the tangents to another locus to which the former is *pedal*.—**Pedal ganglia**, infra-esophageal ganglia in the nervous system of *Mollusca*. See cut under *Lamellibranchiata*.—**Pedal harmony**, in *music*, same as *harmonies consonantes*.—**Pedal key**, in *organ-building*. See *key*.—**Pedal keyboard**, in *organ-building*, the keyboard or set of levers intended to be played by the feet. It consists of black and white keys like the manual keyboards, only on a larger scale. Its usual compass in modern organs is from the second C below middle C to the D or the F next above it. It is sometimes *consonant*, the extreme right and left levers being higher than those in the middle, or *radiating*, the front ends of the levers being nearer together than the back ends—both arrangements being intended to help the player to reach all the keys with equal ease. The *pedal* keyboard properly sounds the stops of the *pedal* organ; but it may also be coupled with either of the manual keyboards, and thus may simply extend the resources of the latter. *Pedal* keyboards are sometimes added to reed-organs, and even to pianofortes. See *pedalier*, and cut under *organ*.—**Pedal line**, a line through the feet of the three perpendiculars to the three sides of a triangle, let fall from any point on the circumference of the circumscribed circle.—**Pedal muscle**, (a) In *human anat.*, same as *extensor brevis digitorum pedis* (which see under *pes*). (b) *Conch.* (1) Any muscle of the foot or podium of a univalve. (2) The posterior adductor of a bivalve, when there are two. See cuts under *Astartidæ* and *Tridacnidæ*.—**Pedal note**, either a note or a tone produced by a *pedal* key, or the same as *organ-point*.—**Pedal organ**, in *organ-building*, that one of the partial organs which, in a pianoforte or *pedal* keyboard, its compass is usually about two or two and a half octaves. Its stops are the deepest and most sonorous in the instrument, usually of 16- or 32-foot tone.—**Pedal origin**, the fixed point from which the perpendiculars are let fall.—**Pedal passage**, in *organ-music*, a passage or phrase intended to be performed on the *pedal* keyboard.—**Pedal piano**, a pianoforte with a *pedal* keyboard or *pedalier*.—**Pedal pipe**, in *organ-building*, one of the pipes belonging to the *pedal* organ.—**Pedal ratio**. See *foot*, 11.—**Pedal rod**, in *harp-making*, a rod connecting a *pedal* with the mechanism for shortening the strings.—**Pedal soundboard**, in *organ-building*, the soundboard of the *pedal* organ.—**Pedal stop**, in *organ-building*, a stop or stop-knob belonging to the *pedal* keyboard.—**Pedal vesicle**, one of the many little vesicles of the water-vascular system of an echinoderm which are connected with the water-vein or tube-vein, and cause the latter to protrude when full of water. See cut at *Echinoidæ*.

II. *n.* (ped'al). 1. Any part of a machine or apparatus which is intended to receive and transmit power from the foot of the operator; a treadle; as, the *pedals* of a bicycle.—2. In musical instruments, a foot-lever; a metal or wooden key or projecting bar operated by the foot. (a) In the pianoforte two or three *pedals* are in use: one to lift the dampers from the strings (the *dampers-pedal* or *tout pedal*); one to introduce a muffer between the hammers and the strings, or to lessen the distance from which the hammers strike, or to move them so that they shall strike only one string instead of the usual two or three (the *soft pedal*); and sometimes one to lift the pipe-stops which happen to be lifted when the *pedal* is pressed down (the *sustaining pedal*). The use of the *dampers-pedal* is usually indicated by some such expression as *una corda*, "one string." The use of the *sustaining pedal* is usually left to the player's discretion. (b) In the pipe-organ several kinds of *pedals* are used: those which form the *pedal* keyboard, and which are like the keys or digitalis for the hands, but much larger (see *pedal keyboard*, and cut under *organ*); those which control the drawing of one or more of the stops (*combination pedals*, *composition pedals*, *crescendo pedal*, *diminuendo pedal*, *sforzando pedal*, etc.); that which controls the opening and closing of the swell-box (the *swell pedal*), etc. See the phrases below. (c) In the reed-organ and harmonium, one of the treadles by which the player operates the feeders of the bellows. See *reed-organ*. (d) In the harp, one of the foot-levers whereby all or some of the strings may be temporarily shortened, and their pitch raised. In modern harps seven *pedals* are used, any one of which may be used in two ways, raising the pitch either one or two half-steps; every *pedal* affects only the strings of a particular letter-name. By combining the *pedals* in various ways the instrument may be set in any desired key (tonality). See cut under *harp*. (e) Collectively, same as either *pedal keyboard* or *pedal organ*.

3. Same as *organ-point*.—4. A *pedal* curve or surface, or one of which another is the *pedal* curve or surface.—**Balanced pedal**. See *swell-pedal*.—**Combination pedal**, in *organ-building*, a metal *pedal* which enables the player to control the use of several stops at once by his feet. Such *pedals* are placed above the *pedal* keys beginning with those of the great organ. They include a *forte pedal* (single-acting), which draws all the stops of the keyboard to which it belongs; a *mezzo pedal* (usually double-acting), which draws most of the important 8-foot and 4-foot stops of its keyboard; and a *piano pedal* (single-acting), which retires all but one or two of the lighter stops. Such *pedals* are placed above the *pedal* keys beginning with those of the great organ. The only species, *P. Murex*, is a native of India and tropical Africa. It is a smooth annual herb, with musky odor, somewhat branching, with opposite or alternate broad and coarsely toothed leaves, and yellow flowers solitary in the axils. The fresh branches stirred in water or milk render it temporarily mucilaginous without changing the taste, odor, or color. Pedicularis (*pē-dik'ü-lä-ris*), *n.* [NL. (*Rivinus*, 1690), < *L. pedicularis*, sc. *herba*, lousewort, prop. adj., pertaining to lice: see *pedicular*.] A large genus of scrophulariaceous plants, of the tribe *Euphrasieae*, formerly made the type of a distinct order *Pedicularales* (Jussieu, 1789), and characterized by the equal anther-cells and alternate or whorled leaves; lousewort. There are over 135 species, mostly montane, alpine, or arctic, natives of Europe, North America, and northern and central Asia, and (a very few) of the mountains of South America and India. They are perennial herbs, with the leaves pinnately or irregularly cut, developed chiefly at the base of the stem and becoming bract-like above. The flowers form a terminal spike, usually yellow or reddish, often one-sided, and followed by compressed projecting curved and beaked capsules. *P. Canadensis* is the wood-betony or high heal-all, common in North American woodlands, with fine-cut fern-like leaves and curving yellow and red variegated flowers. *P. Scyrium Carolinum* is the King Charles's scepter, a tall wand-like Scandinavian species with abundant purple and gold flowers. Some species are cultivated, chiefly from seed, and are known collectively as lousewort, or swamp-louseworts or red-rattles, long imagined to breed life in sheep that feed on them—an idea apparently founded merely on their presence in poor soil.

It is generally accepted in the sense (b) by European ichthyologists, and in the sense (d) by all recent American ichthyologists. The principal characters are the connection of the vertebral column with the skull by suture, the junction of the epiotics behind the supraccipital, the elongation and reduced number of the actinoptics supporting the pectorals, and the position of the branchial apertures in the axillæ of the pectorals. E. also *pedigre*, *pedegree*, *pedigree*, *petigree*, *pettigree*, *petigrew*, *petigree*, < M.E. *pedegru*, *pedegru*, *pedygru*, *pedegreue*, *petygru*, in *Prompt. Parv.* (A. D. 1440), also in documents a few years earlier, *pedegree*, *petygru*, *pedigree*, and in M.L. *pedier*, *pe de grue*, *pedigree*—the orig. type indicated by these forms being *pedegru*, or "*pedegru*, or as three words "*pe de grue*, obviously of OF. origin. The only OF. term answering to this form is *piéd de grue*, crane's foot: *piéd*, *piet*, *pie*, nom. also *pez*, < *L. pes* (*ped-*), foot; *de*, < *L. de*, of; *grue*, < *L. grus*, crane: see *foot* (and *pedal*, etc.), *de*, *Grus*, and *crane*. No record of the use of OF. *piéd de grue* in the sense of "*pedigree*," or in any relation thereto, has been found; if so used (and no other explanation of the M.E. forms seems possible), it must have been a fanciful application, in restricted AF. use, perhaps in allusion to the branching lines of a pedigree as drawn out on paper (cf. *crane's-foot*, applied to the lines of age about the eyes). The crane was at the time in question very common in England and

France, and it figures in many similes, proverbs, and allusions. The term appears to be extant in the surname *Pettigrew*, *Pettigrew* (from the early mod. E. *pettigrew*, ME. *petygru*, etc.). For the form, and the use as a surname, cf. the modern surname *Pettifer*, *Pettifer*, < ME. *Pedifer*, *Pedefer*, < OF. *piéd de fer*, 'iron foot.' Of the various other explanations of *pedigree*, as OF. *par degré* (Minsheu), 'by degrees,' "pere degré, i. e. descensus seu parentela maiorum" (Minsheu), lit. 'father-degrees,' "petit degree" (actually so spelled in one instance in Stanishurst), or other suggestions involving *petty* or *degree*, none is tenable. The mod. = *Syn. Pedigree, Genealogy, Lineage*. *Pedigree* may be used with reference either to a person or to an animal, as the *pedigree* of a horse; the others only to a person or family. In some cases it extends to geologic time: as, the *pedigree* of the Cretaceous horset. *Genealogy* is the series of generations, coming down from the first known ancestor. *Lineage* views the person as coming in a line of descent, generally honorable, which, however, need not be traced, as in a *genealogy* or *pedigree*. *Pedigree* and *lineage* are generally much narrower words than *genealogy*, the last usually covering some personal history and including details of various matters of interest to the persons or families concerned.

They bear fleshy branches, with an acid milky juice, alternate stem-leaves and opposite floral leaves, and flowers surrounded by greenish or colored bractlets, arranged in terminal or axillary cymes. Several species are cultivated as evergreen shrubs in greenhouses, and from the shape of the involucre are known as *slipper-plants*. *P. tithymaloides*, of the West Indies and South America, known as *jeu-bush*, is used in medicine as an emetic.

sance styles the same name is given to gables similarly placed, even though not triangular in form, but semicircular, elliptical, or interrupted, and also to small finishing members of any of these shapes over doors or windows. In the architecture of the middle ages small gables and triangular decorations over openings, niches, etc., are often called *pediments*. These generally have the angle at the apex much more acute than the corresponding gable or gabled in Roman architecture, which, on its part, is markedly higher in proportion, or less obtuse-angled at the summit, than Hellenic *pediments*. See also lists under *acroterium*, *octastyle*, and *pedimented*.

The first pair of legs is longest, and the tarsus is broken into a long series of joints. In a former system, when the *Pedipalpi* also included the true scorpions, the term was synonymous with *Polymenomatata* and coextensive with *Arthrogastra*. (b) In France, formerly a chief vassal, and later the lord of a certain territory; during the period from 1814 to 1848, a member of the upper house of the legislative assembly.—*House of Peers*, the upper house of the British Parliament, usually styled the *House of Lords*. The hereditary summoning of a large proportion of great vassals was a middle course between the very limited peerage which in France co-existed with an enormous mass of privileged nobility, and the unmanageable, ever-varying assembly of the whole mass of feudal tenants as prescribed in Magna Carta. It is to this body of select hereditary barons, joined with the prelates, that the term "peers of the land" properly belongs; an expression which occurs first, it is said, in the act by which the Despensers were exiled, but which before the middle of the fourteenth century had obtained general recognition as descriptive of members of the house of lords. Pelagianism (pē-lā'-ji-an-izm), *n.* [< *Pelagian²* + *-ism*.] The doctrines of Pelagius, a British monk (flourished about A. D. 400), and his followers. They held that there was no original sin through Adam, and consequently no hereditary guilt, that every soul is created by God sinless, that the will is absolutely free, and that the grace of God is universal, but is not indispensable; and they rejected infant baptism. Pelagius, however, held to the belief in the Trinity and in the personality of Christ. His views were developed by his pupil Cœlestius, but were anathematized by Pope Zosimus A. D. 418. Pelagianism was the principal anthropological heresy in the early church, and was strongly combated by Pelagius's contemporary Augustine.

The *pelagic fish fauna*, as defined by the author [John Murray], consists, first, of the truly pelagic fish, those which habitually live on the surface of the ocean. . . . Secondly, there are a number of fishes inhabiting the depths of the ocean, from a hundred fathoms downwards, which seem periodically to ascend to the surface, possibly in connection with their propagation. Thirdly, the *pelagic fauna* receives a very considerable contingent from the littoral fauna. *Nature, XLII. 217.*

See under *pelican*.

Pelecanoides (pel'e-kā-noi'dēz), *n.* [*NL.* (Lacépède, 1800-1), < *Gr. πελεκάν*, a pelican, + *-ειδής*, form.] A singular genus of the petrel family, *Procellariidæ*, representing the subfamily *Pelecanoidinæ* (or *Halodrominæ*): so called from the width of the chin and distensibility of the throat, suggestive of a pelican's pouch. The bill is broad, and the nasal tubes are vertical, the nostrils opening directly upward, unlike those of any other petrel; and the wings are short, contrary also to the rule in this family. The birds dive with facility, and resemble little auks rather than petrels. Two or three species inhabit southern seas, as *P. urinatoria*. The genus is also called *Halodroma* and *Puffinaria*.

Pelecanoidinæ (pel-e-kān-oi-di'nō), *n. pl.* [*NL.*, < *Pelecanoides* + *-inæ*.] A subfamily of *Procellariidæ*, represented by the genus *Pelecanoides* alone. Also called *Halodrominæ*.

only genus of *Pelecanidæ*, having the bill slender and several times as long as the head, with a hook or nail at the end, and the mandibular rami divaricated, supporting an enormous pouch. The wings are extremely long, with very numerous remiges. The tail is short, and consists of 20 or more feathers; the feet are short and stout, and all four toes are webbed. (See under *totipalmate*.) The size is great, and the form is robust. The weight of the body in proportion to its bulk is reduced by its great pneumaticity. There are at least 6 perfectly distinct species, and some authors admit 9. Two inhabit the United States—the white and brown pelicans, *P. trachyrhynchus* and *P. fusces*. (See cut under *pelican*.) The European species, inhabiting also Asia and Africa, are *P. oncorhynchus* and *P. crispus*. The character of the foot is best shown by some stork, as, for example, the Indian and African episcopal stork (*Dissoura episcopus*), whose generic name, however, indicates a remarkable peculiarity of the tail, which is black and forked, with long white under tail-coverts projecting beyond the true tail-feathers, as illustrated in the figure. They are herbs or shrubs, often viscid-pubescent and odoriferous, sometimes fleshy, bearing opposite undivided or dissected leaves, and flowers of scarlet, pink, white, or other colors, usually conspicuous and in umbels. Many species are cultivated for their handsome flowers or fragrant leaves, and from their strong tendency to hybridize these have produced very numerous varieties; those of *P. grandiflorum*

Cf. πελεκάν (πελεκάντ-), a woodpecker, < πελεκάν, hew or shape with an ax, < πέλεκυς = Skt. paragi, an ax, a battle-ax.] 1. A large piscivorous natatorial bird of the family *Pelecanidae* and genus *Pelecanus*, having an enormously distensible gular pouch. Pelicans of some species are found in nearly all temperate and tropical countries. Deriving their whole sustenance from the water, they frequent lakes, rivers, and sea-coasts, and generally secure their prey by wading or swimming and scooping it into their pouches, though some, as the brown pelican, swoop down on the wing, like gannets. They breed usually on the ground near water, laying from one to three eggs, white-colored, equal-ended, and of rough texture. They are gregarious, and gather in immense companies at their*

breeding-resorts. The birds are about as large as swans, and their short legs constrain them to an awkward waddling gait, but their flight is easy, firm, and protracted. The sexes are colored alike. The plumage is in most cases white, variously tinted with yellow and rose hues. The American white pelican, *P. trachyrhynchus*, is five feet long and eight or nine feet in extent of wings; the general plumage is white, with black primaries, and yellow lengthened plumes on the back of the head and on the breast. The bill is surmounted in the breeding-season by a curious horny crest which is deciduous. (See *cut at rough billed*.) The brown pelican, *P. fuscus*, is of dark and varied colors, the other birds of the same order, as cormorants, gannets, etc. The myth probably arose in connection with the fabulous phoenix, and may have been borne out by some facts which have been observed in the case of the flamingo (*Phoenicopterus*), possibly furthermore acquiring some plausibility, in its application to the pelican, from a red tint that is observable on the beak or plumage of some species. The pelican has from early times been considered as an emblem of charity. See also *cut under totipalmate*.

pelvis (pē'vis), *n.*; pl. *pelvies* (pē-*vēz*). [*< L. pelvis*, a basin, laver; cf. *Gr. πέλαις*, *πέλλαις*, *πέλλα*, a bowl: see *pelike*.] 1. A bony basin forming the most inferior or posterior one of the three great cavities—thoracic, abdominal, and pelvic—of the trunk of most terrestrial vertebrates. A perfect pelvis is formed on each side by the haunch-bones, consisting of ilium, ischium, and pubis, meeting in front at the pubic symphysis, and completed behind by the sacrum, with which the iliac bones articulate, and by more or fewer coccygeal or caudal vertebrae. But the pubic symphysis is wanting, as a rule, in animals below mammals: there is sometimes an ischiac and often an iliac symphysis. In any case, a recognizable ilium or ischium or pubis, however rudimentary, constitutes in so far a pelvis. The human pelvis is complete, and

1, crest of ilium; 2, base (uppermost) of sacrum; 3, symphysis pubis; 4, acetabulum or socket of thigh-bone; 5, iliac fossa, a part of the false pelvis; 6, ischium; 7, obturator foramen; 8, iliopectineal line, or brim of true pelvis; 9, Coccyx, not shown, directly behind pubic symphysis.

of normal composition, but remarkable for its shortness, width, axial curvature, and obliquity with reference to the long axis of the body. A perpendicular to the plane of the inlet would leave the abdomen at the umbilicus, and a perpendicular to the plane of the outlet would strike the promontory of the sacrum. The pelvis is divided into *true* and *false*—the latter being that part which is above the iliopectineal line, the former below the same line, which thus represents, in part, the brim or superior strait of the true pelvis. The false pelvis is broad and shallow, composed, as far as bone is concerned, chiefly by the flaring iliac fossae, its front wall being made by the lower part of the abdominal parietes; and in the erect attitude the mass of abdominal viscera rests largely upon this part of the basin. The true pelvis is more contracted, and chiefly bony as to its walls. Its inlet or superior plane, cordiform in shape, is circumscribed by the pelvic brim, which is formed by the iliopectineal crest, completed in front by the spine and crest of the pubes, and behind by the curved ridge and promontory of the sacrum. The lower plane, or outlet, known also as the inferior strait, is bounded by a very irregular line of bone, the point of the coccyx being

Pelvis of Horse (sacrum and coccyx removed), leaving the bones representing the "quarter", viewed from left side and behind. 1, crest of ilium; 2, surface for articulation with sacrum (not shown) to complete the pelvis; 3, narrow part of ilium; 4, acetabulum for hip-joint; 5, a small part of right pubis; 6, ischium.

in the middle line behind, and the tuberosity of the ischium on each side; between which three points the bony outlet is deeply emarginated behind, on each side, by the great sacrospinous notch, and in front by the arch of the pubes, formed by the united rami of the pubes and ischia. In life these notches are largely filled in by ligaments (the greater and lesser sacrospinous ligaments on each side, and the triangular or infrapubic ligament in front). The obturator membrane also closes in

what would otherwise be a large cavity on each side, the obturator foramen. The inlet is closed by the levator ani muscle, the skin of the perineum, and associated soft parts. The pelvic cavity contains the lower bowel and most of the organs of generation. After puberty the male and female pelvis differ usually to a recognizable extent, the size and shape of the male being more massive and contracted, that of the female lighter and more expansive. See also cuts under *Catarrhinia*, *Dromæus*, *Elephantine*, *Equidae*, *innominatum*, *ligament*, *Ornithoscelidae*, *oz*, *quarter*, and *sacrum*.

3. [*cap.*] A genus of mollusks.—**Brim of the (true) pelvis**, the periphery of the pelvic inlet, separating the false from the true pelvis. In man it is formed by the top of the pubes in front, the promontory of the sacrum behind, and on each side by the iliopectineal line.—**False pelvis**. See *def.*—**Flat pelvis**, a pelvis in which the conjugate diameter of the inlet is proportionally short.—**Nagele's pelvis**, an obliquely distorted pelvis.—**Pelvis major**, the false pelvis.—**Pelvis minor**, the true pelvis.—**Robert's pelvis**, a transversely contracted pelvis, resting from ankylosis of the sacro-iliac articulations.

2. A quill, as of a goose or other large bird, cut to a point and split at the nib, used for writing; now, by extension, any instrument (usually of steel, gold, or other metal) of similar form, used for writing by means of a fluid ink.

Various forms of Pens.

1, quill pen, in which *a* is the feather, *b* the body, and *c* the nib; 2, steel pen and penholder, *a* being the handle and *b* a ferrule fitted to *a* and having a clamping socket into which the pen *c* is inserted and there held by pressure; 3 and 4, fountain-pens: the body of the handle *a* is a hollow reservoir for the ink, *b* is the pen-holding device, and *c* and *d* are metal rods passing through small holes into the ink-reservoir, along which the ink flows by capillary action to keep the pen *e* supplied.

Pens of steel or gold have almost superseded the old quill pens. Pens are also manufactured to some extent of other metallic substances, such as silver, platinum, and aluminium. Gold pens are usually tipped with a native alloy of osmium and iridium. They possess the advantage of being incorrodible by ink, besides having a fine, quill-like flexibility, and are exceedingly durable.

2. Sorrow for sin shown by outward acts; self-punishment expressive of penitence or repentance; the suffering to which a person voluntarily subjects himself, as by fasting, flagellation, self-imposed tasks, etc., as an expression of penitence; the outward acts by which sorrow for sin is shown.

3. *Eccles.*, sorrow for sin shown by outward acts under authority and regulation of the church; contrition manifested by confession and satisfaction and entitling to absolution; hence, absolution ensuing upon contrition and confession with satisfaction or purpose of satisfaction. Absolution has been given on these terms since primitive times in the church, and this ancient institution was afterward formally recognized as a sacrament by the Roman Catholic, the Greek, and other churches. The sacrament of penance includes four parts: contrition, confession, satisfaction, and absolution. It is required that there should be a genuine and a supernatural contrition for the sin committed—that is, a sorrow produced by the influence of the Holy Spirit, coupled with a firm purpose of amendment; that the sin should be confessed fully and unreservedly to a priest; and that satisfaction be made for it by a voluntary submission to such penalty or discipline as the priest may require and by restitution to persons wronged; and absolution can be granted only on these conditions. It can be administered by no one who has not received priest's orders. Every member of the Roman Catholic Church is obliged at least once a year to confess to his parish priest and to do penance under his direction; he cannot partake of communion without previous absolution, but is not either before confession or during his penitential discipline regarded as under ecclesiastical censure, which is inflicted on the contumacious only.

4. The penalty or discipline imposed by the priest in the above sacrament.

the dome by two semicircular or ogival vaults, intersecting at right angles. Upon the pendentives is supported, in place of the upper part of the dome of which they are segments, an independent dome of which the diameter is equal to that of the absent upper part of the first dome, or sometimes a lantern or a tower. The true pendentive is characteristic of Byzantine architecture, and is still commonly used in the various Oriental architectures based upon the style of building of the Greek empire. In it was found the solution of the problem of covering a rectangular space with a vault of circular plan. The term *pendentive* is often extended, but incorrectly, to any architectural device occupying the position of a true pendentive, designed to answer the same purpose, but constructed of courses laid in horizontal beds and projecting each one beyond that below, or of a succession of arches corbelled out, or in any other manner which will meet the case. No such device, however, can be a true pendentive, unless the structure is in both form and construction a segment of a dome.

Cf. *pendule, pendle*.] 1. Anything that hangs down from a point of attachment and is free to swing.—2. In mech., a body so suspended from a fixed point as to move to and fro by the alternate action of gravity and its acquired energy of motion. The time occupied by a single oscillation

or swing is counted from the time of the descent of the pendulum from the highest point on one side till it attains the highest point on the opposite side. This time is

called the *period of oscillation* of the pendulum. A *simple pendulum* in the mechanical sense is a material particle suspended by a weightless rod and moving without friction. A simple weight attached by a string, etc., approximates to an ideal simple pendulum. The period of oscillation of a simple pendulum in vacuo is

$$T = 2\pi \sqrt{\frac{l}{g}} \cdot (1 + \frac{1}{16} A^2 + \dots)$$

where $\pi = 3.14159$, g is the acceleration of gravity, l is the length of the pendulum, and A is the total arc of oscillation. The quantity in parentheses is not affected by the radical sign. It will be seen that, unless the arc is very large, the period is almost independent of its magnitude. A *compound pendulum* is any pendulum not simple. The same formula for the period applies, l being the square of the radius of gyration divided by the distance of the center of gravity from the axis of rotation. The common clock-pendulum usually consists of a rod of metal or wood, suspended so as to move freely about the point of suspension, and having a flat circular piece of brass or iron heavy material, called a *bob*, attached to its lower end. The metal rod, however, is subject to variations in length in consequence of changes of temperature, and, as the accuracy of the pendulum considered as a regulating power depends upon its always maintaining the same length, various combinations of two different metals, as brass and steel, under the name of *compensation pendulums*, have been adopted in order to counteract the effects of changes of temperature. These take particular names, according to their forms and materials, as the *gridiron pendulum*, the *mercurial pendulum*, the *lever pendulum*, etc. The *gridiron pendulum* is composed of parallel rods of brass and steel, arranged in one plane, and so connected together that the different degrees of expansion of the different metals compensate each other and maintain the compound rod of fixed length. The *mercurial pendulum*, devised by Graham, consists of one rod with a vessel containing mercury at the lower end, so adjusted in quantity that, whatever alterations take place in the length of the pendulum, the center of oscillation remains the same, the mercury ascending when the rod expands, and vice versa. Another form of compensation or compensating pendulum employs a curved bar composed of iron and brass brazed together, which is attached to the rod in a horizontal position, the brass downward. The unequal expansion of the metals under a rise of temperature tends to lift the center of gravity of the bob, and thus to compensate for the simultaneous increase in length of the rod. The pendulum is of great importance as the regulating power of clocks. One kind is nothing more than pendulums with wheel-work attached to register the number of vibrations, and with a weight or spring having force enough to counteract retarding effects of friction and the resistance of the air. A *reversible pendulum* is a pendulum so arranged that it may be suspended from either of two axes on its length at unequal distances from its center of gravity, and so placed that in the two positions each becomes axis of suspension and axis of oscillation, so that the time of vibration shall be the same in both positions. Bessel's reversible pendulum is symmetrical in external figure with respect to the plane equidistant from the two axes. Such a pendulum eliminates the effect of the atmosphere. A pendulum which has exactly one oscillation per second is called a *seconds pendulum* (also written *seconds' pendulum* and *second's pendulum*). The length of a pendulum is the length of the simple pendulum having the same period—that is, the distance between the point of suspension and the center of oscillation (see *center*). In the latitude of New York, and at the level of the sea, the length of the seconds pendulum is 39.1 inches nearly. As the force of gravity diminishes toward the equator and increases toward the poles, the seconds pendulum is shorter in lower latitudes and longer in higher. Besides its use as a regulator in clocks, the pendulum is applied to determine the relative and absolute acceleration of gravity at different places, and in this way the figure of the earth.

The vibrations of such a pendulum are perfectly isochronous.—**Electric pendulum.** (a) See *electric*. (b) A pendulum that at some point of its path closes a circuit, this in turn either reporting the beats of the pendulum at distant stations for time-comparisons, or directly controlling a number of clocks. See *electric clock*, under *clock*.—**Foucault's pendulum.** A conical pendulum with a very long wire and a heavy bob, designed to exhibit the revolution of the earth. At the north pole, the plane of oscillation, really remaining fixed, would appear to rotate about the vertical once in twenty-four hours. At the equator there would be no such effect; and at other latitudes there should be a slower rotation. See *composition of rotations*, under *rotation*.—**Gyroscopic, hydrometric, etc., pendulum.** The adjectives.—**Invariable pendulum.** A pendulum intended to be carried from station to station, and to be oscillated at each so as to determine the relative acceleration of gravity at those points. This method assumes that the pendulum is not bent nor its knife-edges altered in position or sharpness in the course of transportation. Hence it is called *invariable*, not as being incapable of change, but as being secured against change for a limited time.—**Long and short pendulum.** A pendulum for determining the absolute force of gravity, consisting of a bob suspended by a wire the length of which

Boats on this principle are made fast to an anchor or to moorings placed up-stream in the middle of the river.—**Pendulum governor**, in *mech.*, a governor consisting of two revolving pendulums, of equal length and weight, attached to a spindle, the spindle and the pendulums having a common axis of rotation, and the spindle being driven by the motion of the engine or machine to be controlled. The angular velocity of revolution of the pendulums bears a constant ratio to the velocity of the prime mover. The pendulum-rods or -arms are thus made to take and hold a definite angle with the axis of their revolution, so long as the speed of the prime mover remains constant. Increase of speed in the latter increases this angle, and decrease of speed diminishes it. The pendulum-arms are connected by links to a collar that slides on the spindle, and the motion of this collar is made to regulate a valve supplying steam or gas to an engine, a belt-shift that moves a belt on cone-pulleys, or mechanism controlling the partial opening or closing of a gate supplying water to a wheel, etc. The supply of power is thus varied according to requirements, and the variation in velocity is confined to narrow limits. See *governor*, 6.—**Pendulum press**, a punching-press in which the punch is driven into the die by a swinging pendulous lever usually having a ball or weight at its lower end, and actuated by the foot of the operator, while with his hands he holds the piece to be punched.—**Pendulum pump**. = *Syn.* 1. *Penetrate*, *Pierce*, *Perforate*, *Bore through*, *Transfix*. *Penetrate* may mean no more than to make entrance into, and that slowly or with some difficulty, or it may have the meaning of *pierce*. *Pierce* means to penetrate deeply and quickly, and therefore presumably, although not necessarily, with some sharp instrument. (See *Ich. iv.* 12.) *Perforate* and *bore through* mean to make a hole through, the former generally expressing the making of a smaller hole, the latter expressing sustained labor or slowness: as, the book-worm *perforates* leather binding; the carpenter *bore through* a beam; a bullet *perforates* or *pierces* the body. To *transfix* is to pierce through, the instrument remaining in that which is transfixed: as, to *transfix* a bird with an arrow; to *transfix* a butterfly with a pin.

The act of penetrating or piercing.—2. Power of penetrating; specifically, in *gun*, the depth a projectile will pass into any material against which it is fired. The penetration into earth or sand is generally expressed in feet; into armor or metal plating, in inches. The English "thick-plate formula," now much used by artilleryists, is $t = \frac{E}{P} \sqrt{\frac{W}{2005}}$ in which t is the penetration in inches, and E is the energy in foot-tons per inch of circumference of shot.

3. Mental acuteness; discernment; insight: as, a man of extraordinary *penetration*.

It is proportional to the square root of the illuminating power, and for an achromatic telescope is approximately equal to four times its aperture in inches.—**Penetration-twirl**. penguin¹ (pen'gwin), *n.* [Formerly also *pinguin*, *pinguin* (cf. *F. pinguin*, *pinguin* = *D. pinguin* = *G. pinguin* = *Sw. Dan. pingvin*, a penguin, = *Russ. pingvin*, an auk, *[E.]*: origin uncertain. According to one view *< W. pen gwen*, 'white head,' the name being given to the auk in ref. to the large white spot before the eye, and subsequently transferred to a penguin. According to another view, *penguin* or *pinguin* is a corruption (in some manner left unexplained) of *E. dial. penning* or *pinning*, the pinion or outer joint of the wing of a fowl (*< pen², quill, + wing*): this name being supposed to have been given orig. to the great auk (in allusion to its rudimentary wings) and afterward transferred to the penguins.] 1^t. The great auk, *Alca impennis*: the original sense.—2. Any species of the family *Spheniscidae* or *Aptenodytidae*. (See *Spheniscidae* for technical characters.) Penguins are remarkably distinguished from all other birds by the reduction of the wings to mere flippers, covered with scaly feathers (see *Impennis*, *Spheniscidae*), used for swimming under water, but unfit for flight. The feathers of the upper parts have also broad flattened shafts and slight webs, being thus like scales; the feet are webbed and four-toed, though the hind toe is very short; the tail is short and stiff; the general form is stout and ungainly. On land the birds stand nearly erect and waddle clumsily, but they are agile and graceful in the water. They feed on fish and

other animal food, and congregate on shore to breed in penguineries of great extent. Penguins are confined to the southern hemisphere, especially about Cape Horn and the Cape of Good Hope, and islands in high southern latitudes, coming nearest the equator on the west coast of South America, as in the case of Humboldt's penguin of Peru. There are more than a dozen species, referable to three

Emperor Penguin (*Aptenodytes forsteri*).

leading types. Those of the genus *Aptenodytes* are the largest, standing about three feet high, and have a slender bill. The name *Patagonian penguin*, applied to these, covers two species or varieties: a larger, the emperor penguin, *A. forsteri* or *imperator*, and a smaller, *A. pennanti* or *rex*. (See *emperor*.) Jackass-penguins, so called from braying, are medium-sized or rather small, with stout bill, as *Spheniscus demersus* of South Africa and *S. magellanicus* of Patagonia. (See *cut* at *Spheniscus*.) None of the foregoing are crested; but the members of the genus *Eudyptes* (or *Catharactes*), as *E. chrysolope* or *chrysolopha*, known as *rock-hoppers* and *macaronis*, have curly yellow plumes on each side of the head. (See *cut* at *Eudyptes*.) Other medium-sized penguins are *Pygoscelis tentata*, *P. antarctica*, *P. antipoda*, and *Dasyrhamphus adeliae*. The smallest penguin, about a foot long, is *Eudyptula minor* of Australian and New Zealand shores. The largest, which was taller than a man usually is, is a fossil species named *Palaeudyptes antarcticus*, from the New Zealand Tertiary.—**Papuan penguin**, a misnomer of *Pygoscelis tentata*, a penguin of the Falklands and some other islands, but not of Papua.

The penis in the vertebrates is generally, in part at least, homologous with the organ so named in man, but not in the invertebrates; it is sometimes double, as in certain reptiles, crabs, etc. In some invertebrates the term is extended to organs which deposit spermatozoa without being intromittent. Many of the older writers on entomology included under this term all the external male organs of generation, dividing them into the phallus, or true intromittent organ, and the forceps or claspers used in copulation. The corresponding organ of the female sex in mammals is termed the *clitoris*. See cuts under *Dendroica*, *Lepididae*, *Proteolepis*, *Alciops*, *Balanus*, *Cestoides*, and *Squilla*.

2. Eccles., one who makes confession of sin and undergoes, under priestly direction, the ecclesiastical discipline prescribed for its absolution. In the early church the penitents formed a distinct class, which included only those under ecclesiastical censure, admitted to do public penance under the direction of the church. Only marked lapses were recognized, but these were punished with long and severe penalties, sometimes lasting many years. The privilege of penance was usually granted but once. The penitents were classified in four grades—mourners, hearers, kneelers, and standers or consistents. Owing to the change of circumstances and the relaxation of discipline, public confession gradually ceased to be required, but private confession of mortal sins has been considered necessary in the Roman Catholic Church and of divine obligation. The Greek Church still requires confession for all grave sins, but its discipline is not so strict as that of the Roman Church. See *penance*.

Peter's pence, an annual tax or tribute in several countries of northern Europe, consisting of a penny, formerly paid to the papal see at Rome. In England it is said to have originated under Offa of Mercia in the eighth century, and it was abolished by Henry VIII. The old payment called *Peter-pence*, from the days of the Mercian King Offa, was originally made for maintaining an English college in Rome. Baronius and other Roman writers misrepresented this payment as a quit-rent for the kingdom, and acknowledged it as a tribute by Spelman and Collier.

A mathematical figure used in magical ceremonies, and considered a defense against demons. It was probably with this figure that the Pythagoreans began their letters, as a symbol of health. In modern English books it is generally assumed that this is the six-pointed star formed of two triangles interlaced or superposed. (Compare *Solomon's seal*, under *seal*.) Obviously, the pentacle must be a five-pointed or five-membered object, and it should be considered as equivalent to the *pentagram* or *pentalpha*. (See also *pentangle*.) The construction of the five-pointed star depends upon an abstract proposition discovered in the Pythagorean school, and this star seems to have been from that time adopted as their seal.

The genus was formerly classed by Rudolphi, its founder, among the trematoid worms, or flukes, but is now usually referred to the arthropods, and placed in the vicinity of the mites or of the bear-animalcules (Arctinea). The body is long, annulated, and vermiform, limbless in the adult, with four

rudimentary legs in the larva. The sexes are distinct. These parasites, of which there are many species, as *P. tentoides*, three or four inches long, infest man and various other animals, and are sometimes encysted in the human liver and lungs. Also *Pentastomum*, *Pentastomus*, and *Linguatula*.

They record the creation, the diffusion of peoples, and the formation of the Hebrew nation and its history through the sojourn in the wilderness. Opinions regarding the authorship of these books differ greatly. Some scholars believe that they, with the book of Joshua, were written substantially by Moses, Joshua, and their contemporaries; others hold that they were compiled at a much later period (in part about the seventh century B. In the New Testament, a Jewish harvest festival called in the Old Testament (Deut. xvi. 10, etc.) the *feast of weeks* (Hebrew *Shabuoth*), and observed on the fiftieth day after the 14th of Nisan, the date of the celebration of the Passover. The feast of Pentecost, while primarily connected with the celebration of the completion of harvest, by the offering of the first fruits, etc., seems also to have been associated in the minds of the later Jews with the giving of the law on the fiftieth day after their departure from Egypt. It always precedes the Jewish New Year by 113 days. 2. The feast of Whitsunday, a festival of the Christian church, observed annually in remembrance of the descent of the Holy Ghost upon the apostles during the feast of Pentecost. Pentecost is the third of the great Christian festivals, the other two being Christmas and Easter. It is connected with its Jewish predecessor, not only historically (Acts ii. 1-11), but also intrinsically, because it is regarded as celebrating the first fruits of the Spirit, as the Jewish Pentecost celebrated the first fruits of the earth (Lev. xxiii. 17). In the primitive church the term *Pentecost* was used both for Whitsunday and for the whole period of fifty days ending with Whitsunday.

of the luminous body. The figures represent the so-called Hipparchan diagrams of a lunar and a solar eclipse. Any portion of the moon in penumbra appears slightly dimmed, the more so the nearer it is to the umbra. At a station of the earth in the moon's penumbra, the disk of the sun is partially hidden, forming a partial (or, possibly, an annular) eclipse.

=*Syn.* 3. **Parsimonious**, **Penurious**, **Miserly**, **Close**, **Niggardly**, **Stingy**, **Mean**, covetous, avaricious, illiberal, sordid, chary. The first seven words express the spirit or conduct of those who are slow to part with money or other valuable things. **Parsimonious** is perhaps the most general of these words, literally sparing, to spend, but always careful and excessively sparing. **Penurious** means literally in penury, but always feeling and acting as though one were in poverty, saving beyond reason; the word is rather stronger than **parsimonious**, and has perhaps rather more reference to the treatment of others. One may be **parsimonious** or **penurious** through habits formed in times of having little, without being really miserly. **Miserly**, feeling and acting like a miser, is generally applied to one who, having some wealth, clings to it for fear of poverty, or in provision for some possible exigency of the future, or especially for his own sake, as delighting in the mere possession of wealth. **Close** has the vigor of figurative use: it may be a shortening of *close-fisted*. **Niggardly** is the least limited to money, and has the most to do with others; it expresses a meanly parsimonious treatment of others, a neglectful, self-defeating, or stingy saving. **Stingy** expresses the most of probrium: as, Queen Elizabeth was called *frugal* by her friends, *stingy* by her enemies, and *parsimonious* by the rest of the world. It indicates a grudging, narrow-hearted or unreasonable parsimony in giving or providing. **Mean** shows a tendency toward emphasizing the idea of a close or narrow and mean-spirited handling of money. See *avarice*.

penuriously (pē-nū'ri-us-li), *adv.* In a penurious or parsimonious manner; with scanty supply.

The common peony is *P. officinalis*, an herb with large, commonly red flowers, one on a stalk, a native of southern Europe and central Asia. A kindred species, *P. tenuifolia*, of Siberia and parts of Europe, has the leaves finely cut, and hence is called *slender-leaved, fern-leaved, or fringed peony*. A second typical species is the tree-peony, *P. moutan*, a taller shrubby species from China, where it is a favorite, with large rose-colored or nearly white flowers, several on a stalk. These and one or two other species furnish the numerous hybrid, and other varieties of the gardens, which vary greatly in color and are often double. The root of the common peony was an ancient charm and medicine, and still has some repute as a nervine.

The word **nation** stands for a political body viewed as of others, it expresses a similar organization, with intense loyalty and patriotism.

This sense, however, is less common. **Race** is the most common word for all those who seem to make a whole in community of descent and are too numerous to be called a **tribe**, **clan**, or **family**: as, the Anglo-Saxon race is one branch of the Germanic, tracing its descent through certain Low German tribes. **Tribe**, apart from certain peculiar meanings, stands for a subdivision of a race: as the twelve tribes of Israel; ordinarily the word is not applied to civilized persons; we speak of *tribes* of Indians, Arabs, Africans. **Clan** is used chiefly of the old organization of kinsmen among the Scotch Highlanders; where used of others, it expresses a similar organization, with intense loyalty and patriotism.

-Ion (a form expressing action or an active faculty):
"perception," "conception," "imagination," "deduc-
tion," "approbation." Some of these words express also
the result of the action, thereby causing ambiguity on very
important questions. Hence the introduction of the forms

one, < L. *perceptio* (n.), a receiving or collecting,
perception, comprehension, < *percipere*, pp. *per-*
ceptus, obtain, perceive; see *perceive*.] 1. Origin-
ally, and most commonly down to the middle
of the eighteenth century, cognition; thought
and sense in general, whether the faculty, the
operation, or the resulting idea. Most psycholo-
gists since Plato had made two departments of mental ac-
tion, the *orectic* and the *speculative*; the former was called
perception, but it did not include belief founded on tes-
timony. This use of the word is now uncommon in tech-
nical language.

This experiment discovereth *perception* in plants, to move
towards that which should comfort them, though at a dis-
tance.

Bacon.

[The Hobbesians stoutly contending that we have not
the *perception* of anything but the phantasms of material
objects, and of sensible words or marks, which we make to
stand for such objects. *Dr. H. More*, Immortality of Soul.

The two great and principal actions of the mind, . . .
perception, or thinking, and volition, or willing.

Locke, Human Understanding, II. vi. 2.

All the *perceptions* of the human mind resolve themselves
into two distinct kinds, which I shall call impressions and
ideas. *Hume*, Treatise of Human Nature, I. l. 1.

2. The mental faculty, operation, or resulting
construction of the imagination, of gaining
knowledge by virtue of a real action of an ob-
ject upon the mind. It includes the first sensation,
its objectification, its location, its intuitive assimilation
of ideas already in the mind—in short, all the knowledge
that is acquired involuntarily without our being aware
of any process, and which seems to be directly given by
sense. *Perception* may be internal or external.

Perception . . . being the first step and degree toward
knowledge, and the inlet of all the materials of it.

Locke, Human Understanding, II. ix. 15.

Perception is most properly applied to the evidence we
have of external objects by our senses.

Reid, Intellectual Powers, I. l.

Perception is a complex mental act or process. More
particularly, *perception* is that process by which the mind,
after discriminating and identifying a sensuous impression
(simple or complex), supplements it by an accompaniment of
or escort of revived sensations, the whole aggregate of
actual and revived sensations being solidified or "inte-
grated" into the form of a percept—that is, an apparently
immediate apprehension or cognition of an object now
present in a particular locality or region of space.

J. Sully, Outlines of Psychol., p. 152.

The manner in which the constituent elements in a *per-*
ception are combined differs materially from what is first
to be called the association of ideas. To realize this
difference we need only to observe first how the sight of
a suit of polished armour, for example, instantly reinstates
and steadily maintains all that we retain of former sensa-
tions of its hardness and coldness, and coldness, and its up-
then now of tournaments, now of crusades, and so through
all the changing imagery of romance.

J. Ward, Encyc. Brit., XX. 67.

3. An immediate judgment founded on sense
or other real action of the object upon the mind,
more or less analogous to what takes place in
vision. Thus, we are said to recognize our friends by
perception. Also, mathematical, esthetic, and moral judg-
ments founded on direct observation of imaginary or ideal
objects are called *perceptions*.

It is admitted on all sides that the *perception* of an ob-
ject necessarily implies the recognition of the object as
this or that, as like certain objects, and as unlike certain
other objects. Every act of *perception*, therefore, involves
classification.

J. Fiske, Cosmic Philos., II. 107.

Her physical organization, being at once delicate and
healthy, gave her a *perception*, operating with almost the
effect of a spiritual medium, that somebody was near at
hand.

Hawthorne, Seven Gables, vi.

A great method is always within the *perception* of many
before it is within the grasp of one.

Dr. Morjan.

Perhaps the quality specially needed for drawing the
right conclusion from the facts, when one has got them,
is best called *perception*, delicacy of *perception*.

(a) In Bonaparte's system, same as the first family of acanthopterygian fishes in Cuvier's system (*Percoides* in French). It included those with oblong bodies covered with scales which are generally hard or rough, with the operculum or preoperculum (or both) denticled or spinous at the edge, and the jaws and some part of the palate toothed. With such definition it included not only the modern *Percidae* proper, but also many other families. (b) In Günther's system, the representative family of his *Acanthopterygii perciformes*, having perfect ventrals, unarmed cheeks, uninterrupted lateral line, acute teeth in the jaws and on the palate, no barbels, the lower pectoral rays branched, and the ventral fins not scaly. (c) In recent American systems, *Percoides* with an increased number of abdominal and caudal vertebrae, depressed cranium and little prominent cranial ridges, dorsal fins generally separate, and anal with one or two spines. The species are inhabitants of fresh waters, and are represented by two genera common to North America and Europe (*Perca* and *Stizostedion*), several peculiar to the Palearctic region (*Acerina*, *Aspro*, *Percarina*), and the numerous darters, constituting the subfamily *Etheostominae*, peculiar to North America.

It. pericarpio* = *Fr. pericarp*, < *NL. pericarpium*, < *Gr. $\pi\epsilon\pi\iota$, around, + $\kappa\alpha\rho\delta\iota\alpha$, fruit.*] In flowering plants, the seed-vessel or ripened ovary. It should accord in structure with the ovary from which it is derived, but extensive changes frequently take place during fructification by which the original ovarian form is obscured. Thus, by

abortion the original number of cells in the ovary may be reduced in the fruit, as in the oak, chestnut, elm, and birch; or by the intrusion of false partitions the original number may be increased in the fruit, as in *Datura*, *Linum*, *Astragalus*, etc. The pericarp may acquire external accretions, as the wing of the maple, ash, and hop-tree, the prickles on the pod of *Datura*, *Rhus*, etc., or the barbs of the *Boraginaceæ*. Connected organs may modify the ovary, such as the adnate calyx of the apple, the puppus of the *Compositæ*, the persistent style of *Clematis*, the fleshy calyx of *Gaultheria*, or the fleshy receptacle of the strawberry. The walls of the ovary may change in consistence in the mature pericarp, being leaf-like in the pea-pod, columbine, caltha, etc., thickened and dry in nuts and capsules, fleshy or pulpy in berries, and fleshy without but indurated within, as in all stone-fruits. Where the walls of the pericarp are composed of dissimilar layers, the layers are distinguished as *exocarp*, *endocarp*, *epicarp*, *mesocarp*, and *putamen*. In cryptogams the pericarp is a variously modified structure containing certain organs of reproduction. Thus, in the *Characeæ* it incloses the oöspere, while in the *Floridæ* it incloses the carpospores. The term is also sometimes synonymous with the theca or capsule of mosses.

Lithologists are by no means agreed in regard to the nomenclature of the varieties of peridotite. M. F. Wadsworth distinguishes the following: *dunite*, composed almost entirely of olivin, with a few grains of picotite, magnetite, or some other accessory mineral; *saxinite*, a variety consisting of olivin and enstatite; *therzoldtite*, of olivin with enstatite and diallage; *buchnerite*, of olivin, enstatite, and augite; *eulysite*, of olivin and diallage; *picrite*, of olivin and augite. Of these varieties, the first four have been found in meteorites as well as in terrestrial rocks; the others, so far as known, are exclusively terrestrial. Olivin passes readily into serpentine; hence many olivin rocks are found more or less completely altered into that mineral, so that the distinction between olivin and serpentine rocks is one not easily preserved. Peridotite is known to be in some cases an eruptive rock, and is generally supposed to have been such in all cases. That most serpentine rocks are the result of the alteration of some peridotite material is also generally conceded; in some cases may have been peridotite, in some other way is possible, but has not been distinctly proved.

7. In *anc. pros.*, a group of two or more cola. According to the number of cola it contains, a period is dicolic, tricolic, tetracolic, etc. The end (apophysis) of a period must coincide with the end of a word, and is also characterized by admitting of syllaba anceps and hiatus. A single colon treated thus is also regarded as a period (a monocolic period). A monocolic, dicolic, etc., period is a meter. (See *meter*, 1 (b) (2).) Certain periods are known as *lines* or *verses*. (See *line*, 6 (b).) A group of periods is called a *system*.

8. In *music*, a definite and complete division of a composition, usually consisting of two or more contrasted or complementary phrases; a complete musical sentence. The term is somewhat variously used; but it always involves a cadence at the end of the period, by which it is distinctly separated from what follows. 4. In *rhet.*: (a) Of or pertaining to a period or complete sentence; complete in grammatical structure. (b) Noting that form of sentence in which the sense is incomplete or suspended until the end is reached.

These principles afford a simple and sufficient answer to the vexed question as to the value of the *periodic* sentence — or sentence in which the meaning is suspended till the end — as compared with the loose sentence, or sentence which could have been brought to a grammatical close at one or more points before the end.

Milton is the last great writer in the old *periodic* style. J. W. Hale, Int. to Milton's Areopagitica, p. xxxiv.

Doubly periodic, having two periods. — **Doubly periodic functions**, in *math.* See *function*. — **Periodic commensurate**, 1. — **Periodic continued fraction**. See *continued fraction*, under *continued*. — **Periodic curve**, *fever*, etc. See the nouns. — **Periodic function**. This phrase is used in different senses in the calculus of functions and in the theory of functions. In the former, a *periodic* function is one whose operation being iterated a certain number of times restores the variable. Thus $1 - x$ is such a function, since $1 - (1 - x) = x$. But in the theory of functions a *periodic* function is defined as a function having a period. For a more general definition, see *function*. — **Periodic inequality**, a disturbance in the motion of a planet dependent upon its position in its orbit relative to another planet, and hence going through its changes in periods not excessively long: opposed to *senary inequality*, which is a disturbance dependent upon the relative positions of two planetary orbits. — **Periodic law**, in *chem.*, a relation of chemical elements expressed by the statement that the properties of the elements are periodic functions of their atomic weights. If the chemical elements are arranged in the order of their atomic weights, at regular intervals of the series will be found elements which have similar chemical and physical properties — that is, there is a periodic recurrence of these properties. If the elements showing this periodic recurrence are arranged in order by themselves, they form a group which, having similar properties and relations, follows a regular progression in the individual differences of its members. — **Periodic stars**. See *star*. — **Periodic winds**. See *monsoon* and *trade-wind*.

Several periotic bones are found in nearly all vertebrates. They may all remain distinct throughout life, but they are usually more or less confluent with one another, and may be, as in man, completely fused; furthermore, they may anklylose with other cranial bones, and thus give rise to certain parts of the compound temporal bone. The parts of skull called *mastoid* are commonly outgrowths of periotic bones. The set of periotic bones composes a bony case for the inner ear, such as the case of a watch covers the works, and this is termed the *otocranium*, *otic capsule*, or *skull of the ear*. When mastoid parts are super-

added, the resulting bone is called *petromastoid*. The human periotic bones form what are called the *petrous* and *mastoid* sections of the temporal bone. Periotic bones which have been distinguished and named in various animals are the *epiotic*, *prootic*, *opisthotic*, and *periotic*. See these words, and cut under *hyoid*.—**Periotic fenestra**, a cavity or depression included by the conspicuous superior semicircular canal, in the fetus or infant.

It is used in piloting submarine boats, and consists substantially of a vertical tube with a lenticular total-reflection prism at the top, by which horizontal rays are projected downward through the tube, and brought to a focus, after which they are received by a lens the principal focus of which coincides with that point. The vertical focal point of the lens is converted into a horizontal cylindrical beam thus formed is converted into a horizontal one again by a mirror inclined at 45° from the vertical axis of the tube, and is thus conveyed to an eyepiece, through which, by turning the tube on its vertical axis with its attached prism, a view of all the supernatant objects around the vessel may be obtained. membrane of the Fallopian tubes, or oviducts. From the walls of the abdominal and pelvic cavities it is reflected at various places over the viscera, which it serves to invest and at the same time hold in position by its folds or duplicatures. These folds or duplicatures are of various kinds. Some of them, constituting the mesenteries (see *mesentery*), connect certain parts of the intestinal canal with the posterior abdominal walls; others form the so-called ligaments of the liver, spleen, stomach, and kidneys; the broad ligaments of the uterus, and the suspensory ligament of the bladder; still others form the omenta, folds attached to the greater and lesser curvatures of the stomach. That part which lines the abdominal and pelvic walls is called the *parietal* or *external* peritoneum; that which more or less completely invests the viscera, the *visceral* or *internal*. The cavity of the peritoneum is divided into two unequal parts by the constriction at Winslow's foramen: of these, the upper posterior one, lying back of and below the stomach and liver, is called the lesser cavity; the greater cavity lies in front and below. In vertebrates below mammals, in which there is no diaphragm, the peritoneum and the pleura (which is the corresponding thoracic serous membrane) are thrown into one, lining the whole pleuroperitoneal cavity and investing its contained viscera. The name *peritoneum* is extended to various similar or analogous, though not necessarily homologous, membranes or tunics which line the body-cavity of many different invertebrates.

2. In brachiopods, an investment of the alimentary canal, by which the latter is suspended in the perivisceral cavity as by a mesentery. Special folds form the gastroparietal and ileoparietal bands, respectively connecting the stomach and intestines with the parietes.

3. In *entom.*, the outer coat of the digestive tube of an insect.

Acute diffuse or general peritonitis was formerly often called *inflammation of the bowels*, involving some confusion with the much less serious disease enteritis. The causes of acute diffuse enteritis are various and often obscure.—**Cellular peritonitis**, peritonitis in which there is simply a hyperplasia of the endothelial cells of the peritoneum.—**Hemorrhagic peritonitis**, peritonitis with sanguinolent effusion, as, for instance, in some cases of tubercular peritonitis.—**Pelvic peritonitis**. What is called a *perivisceral cavity* may be one of four things: 1. A cavity within the mesoblast, more or less representing the primitive blastocoel. 2. The alteration evidently took place in E., in simulation of the F. pron., and could hardly be due to D. *peruyk* (Sewel), as Skeat explains it. The D. form at the time in question was *perryuycke*, *perhuycke* (Kilian). Similar interchange of *wi* (*ui*) and *u* appears in the history of *cubeb* (ME. *quibibe*, etc.), *cushion* (ME. *quishsen*, etc.), *cut* and *quid* (AS. *cuðu*, *cuidu*), *quick* (AS. *cwiuc*, *cucu*), etc. From *perwig*, regarded appar. as < *peri-* + *wig*, as something put 'around' the head, was derived, by omission of the supposed prefix, or by mere abbreviation (as in *bus* for *omnibus*, *van* for *caravan*, etc.), the form *wig*: see *wig*.] 1. These are natives of southern Europe, trailing plants with deep-colored evergreen leaves and blue flowers, in *V. minor* varying to white—often known as *myrtles*. The small species is the more hardy, and hence the more common northward. *V. herbacea*, another European species, differs from these in that its tops die down annually. *V. rosea*, sometimes called *Madagascar periwinkle* though native of tropical America, is an erect plant with continuously blooming showy rose-purple or white flowers, excellent for bedding or in the greenhouse.

E. also *perwinke*, *perwinkle*, *perwinkil*, *perwinkil*, *perwinke*, *perewinkle*, no ME. form found; commonly referred to AS. **pinewincle* or **pinewincula*, found only in pl. *pinewinculan*, in the ML. glosses, "torneiculi, *pinewinculan*," sea-snails (Wright's *Voc.*, ed. Wülfker, 94, 14), "chelio, testudo, uel marina gugalina, sēsnael ["sea-snail"] uel *pinewinculan*" (id., 122, 23); but according to the entry in Bosworth (ed. Toller), *pinewinculan* is here an error for *winewinculan* (due to the frequent confusion of the AS. *p* and *w*, which are very much alike in the manuscripts); the first element in *pinewinculan* or *winewinculan* is uncertain; the second, *wincle*, appears as E. *winkle*: see *winkle*. Wedgwood, referring to the equivalent dial. name *pennywinkle* and *pinpatch*, explains *periwinkle* or the supposed AS. *pinewincle* as "pinwinkle, or winkle that is eaten by help of a pin used in pulling it out of the shell." For this there is no evidence. The form seems to be corrupt. Cf. *periwinklet*, *perwig*.] 1. A kind of sea-snail; any member of the family *Littorinidae*, and especially of the genus *Littorina*. Permian (pér-mi-an), *a.* and *n.* [*ML. "Permianus*, < *Permia*, *Perm* (see def. I.).] **I. a.** 1. Relating to the city or government of Perm in eastern Russia.—**2.** Relating to the Permians.—**3.** An epithet applied by Murchison and his coadjutors in a geological reconnaissance of a part of Russia, in 1841, to a group of strata overlying the Carboniferous, and forming the uppermost division of the Paleozoic series. The rocks of which the Permian system is composed are largely red sandstone, and their equivalent in England had then been known as the *New Red Sandstone*, to distinguish it from the *Old Red Sandstone*, which lies beneath the Carboniferous. Eventually the New Red of England was found to be divisible (paleontologically) into two groups, of which the older was named with the Paleozoic, and the newer placed in the Mesozoic. In Germany there is a well-marked division of the Permian into two lithologically distinct groups; hence it is sometimes designated as the *Dyas*, a name coined in imitation of *Trias*. The divisions of the Permian in Germany are a lower series of sandstones, red and mottled in color (hence the name *Pechelitz* has been applied to them), called the *Rothliegendes*, and an upper series of dolomites, marls, limestones, etc., called the *Zechstein*. The flora of the Permian in general closely resembles that of the Carboniferous, and several of the most characteristic plants of the latter pass upward into the Permian, but rise no higher. The cycads appear first in the Permian, and are largely increased in number and importance in the Trias. The Permian fauna is, on the whole, less rich than those of the overlying and underlying groups. The Permian is of great economical importance in Europe, as the repository of extensive deposits of rock-salt, gypsum, and other saline combinations.

The terms representing odd numbers of displacements are generally taken as affected with the negative sign. If the indices are separated into sets, only those of each set being interchanged, the permutant is said to be *compound*, as opposed to a *simple permutant*, of which, however, it may be regarded as a special variety.

3. In *math.*, a linear arrangement of objects resulting from a change of their order. *Permutation* differs from *combination* in this, that in the latter there is no reference to the order in which the quantities are combined, whereas in the former this order is considered, and consequently the number of permutations always exceeds the number of combinations. If *n* represents the number of quantities, then the number of permutations that can be formed out of them, taking two by two together, is $n \times (n-1)$; taken three and three together, it is $n \times (n-1) \times (n-2)$; and so on. Sometimes called *alternation*. See *combination*, 5.

2. In *geom.*, meeting a given line or surface (to which it is said to be perpendicular) at right angles. A straight line is said to be *perpendicular* to a curve or surface when it cuts the curve or surface in a point where another straight line to which it is perpendicular is tangent to the curve or surface. In this case the perpendicular is usually called a *normal* to the curve or surface.

sixteenth. The window exhibits most clearly the characteristics of this style, which differs from others in that a large proportion of the chief lines of its tracery intersect at right angles. It corresponds in art-development to the French Flamboyant of the fifteenth century, but is without the grace, richness, and variety of French work, though some of its buildings present fine effects of masses. See also *cut* under *molding* and *pinnacle*.

II. n. 1. A line at right angles to the plane of the horizon; a line that coincides in direction with a radius of the earth or with the direction of gravity.—**2.** In *geom.*, a line that meets another line or a plane at right angles, or makes equal angles with it on every side. Thus, if the straight line AB, falling on the straight line CD, makes the angles ABC, ABD equal to one another, AB is called a *perpendicular* to CD, and CD is a *perpendicular* to AB. A line is a perpendicular to a plane when it is perpendicular to all lines drawn through its foot in that plane.

Thus, a party in possession of property, and fearing that his right or that of his successors might at some future time be disputed, was allowed in chancery to file a bill merely to examine witnesses, in order to preserve that testimony which might be lost by the death of such witnesses before he could prosecute his claim, or before he should be called on to defend his right.

3. In law: (a) A limitation intended to be unalterable and of indefinite duration; a disposition of property which attempts to make it inalienable beyond certain limits fixed or conceived as being fixed by the general law. *Pollock*. The evils incident to rendering any specific piece of land or fund inalienable, and thus shutting it out from the general circulation of property, early led the courts to hold provisions for a perpetual suspension of the power of alienation to be void. The desire of owners of estates to perpetuate the wealth of the family led to attempts to create forfeitures and gifts over to other states, by way of shielding the successor in the title from temptation to alienate; and as the right to create life-estates and trusts, and to add gifts over to other persons upon the termination of precedent estates, could not be wholly denied, the question has been what temporary suspension of the power of alienation is reasonable and allowable, and what is too remote and to be held void as "tending to create a perpetuity." (See *remoteness*.) The limit now generally established for this purpose in varying forms is substantially to the effect that no disposition of real property or creation of an estate therein is valid if it suspends the absolute power of alienation for more than a period measured by a life or lives in being plus 21 years and 9 months. Hence, since literal perpetuities are no longer known, except in the law of charities, etc., the phrase *rule against perpetuities* has come to mean in ordinary usage the rule against future estates which are void for remoteness as "tending to create a perpetuity." (b) Duration to all futurity; exemption from intermission or ceasing.

Cf. *assist*, etc.] To continue steadily and firmly in some state, course of action, or pursuit, especially in spite of opposition, remonstrance, etc.; persevere, especially with some degree of obstinacy.

Thus to *persist*
In doing wrong extenuates not wrong,
But makes it much more heavy.

As you have well begun, and well gone forward, so well *persist* and happily end.
J. Bradford, Letters (Parker Soc., 1853), II. 71.

persistence (pér-sis'tens), *n.* [Also *persistance*; < *F. persistance = Sp. Pg. persistencia = It. per-*

sistenza, < ML. **persistētia*, < L. *persistē(t)-*, persistent: see *persistent*.] 1. The quality of being persistent; steady or firm adherence to or continuance in a state, course of action, or pursuit that has been entered upon; especially (of persons), a more or less obstinate perseverance; perseverance notwithstanding opposition, warning, remonstrance, etc.—2. The continuance of an effect after the cause which first gave rise to it is removed: as, the *persistence* of the impression of light on the retina after the luminous object is withdrawn; the *persistence* of force.—**Persistence of force**, the law of mechanics. The phrase was introduced by Herbert Spencer to sum up all the laws of mechanics, especially the two principles of the permanence of matter and the conservation of energy. The law of action and reaction may be considered as consisting in the persistence of the algebraic sum of the momenta; and in fact every such law may be stated in an integrated form which contains an arbitrary constant independent of the time.—**Persistence of vision**, the continuance of a visual impression upon the retina of the eye after the exciting cause is removed. The length of time varies with the intensity of the light and the excitability of the retina, and ordinarily is brief, though the duration may be for hours or even days. The after-image may be either positive or negative, the latter when the bright parts appear dark and the colored parts in their corresponding contrast-colors. It is because of this persistence that, for example, a firebrand moved very rapidly appears as a line or circle of light. The phenakistoscope, zoetrope, and other similar contrivances depend for their effect upon this principle.—**Syn.** 1. *Industry, Application*, etc. (see *assiduity*), pertinacity, doggedness.

persistence (pér-sis'tēn-si), *n.* [*As persistence* (see -cy).] Same as *persistence*, 1.

By this hand, thou thinkest me as far in the devil's book as thou and Falstaff for obduracy and persistency.

Persisting or continuing in spite of opposition, warning, remonstrance, etc.; refusing to cease or give up some action, course, or pursuit; persevering: as, a *persistent* beggar; *persistently* attempts to do something.

Henceforward rarely could she front in hall,
Or elsewhere, Modred's narrow foy face,
Heart-hiding smile, and gray persistent eye.

3. The art of representing solid objects on a flat surface so that when they are viewed the eye is affected in the same manner as it would be by viewing the objects themselves from a given point. By *perspective*, in common language, is meant *linear perspective*, or the art of delineating the outlines of objects, of their shadows, and of their reflections. The theory is that the positions of the delineated points in the picture are such that if rays, or straight lines, were drawn from the corresponding original points in the natural objects to the eye of the spectator, and if the picture were then interposed in the right position, it would be pierced by these rays at the points of delineation. It follows that perspective supposes that a picture is to be looked at with one eye placed in a particular position; and if it be otherwise looked at, the perspective necessarily appears false. This position of the eye, called the *station*

JBCK, an original plane; *KCDL*, another original plane; *CK*, their intersection, an original line; *ABCD*, plane of delineation; *E*, station point; *EF*, directing plane; *EADH*, vanishing plane of original plane *JBCK*; *BC*, its intersecting line; *AD*, its vanishing line; *FG*, its directing line; *EABF*, vanishing plane of original plane *KCDL*; *DC*, its intersecting line; *AB*, its vanishing line; *HC*, its directing line; *C*, intersecting point of line *CK*; *A*, its vanishing point; *G*, its directing point; *EG*, its director; *AC*, its delineation.

point, or point of sight (which phrase with old writers has, however, another meaning), is, according to the directions of most treatises, placed much too near the picture to represent the mean position of a person looking at it. *Ar*

tists consequently find it necessary to modify the forms which strict perspective would prescribe. To ascertain how an *original line or plane* (that is, a line or plane in nature) is to be delineated, we have to consider, first, the *intersecting point or line*, which is the point or line where the *original line or plane*, extended if necessary, cuts the *plane of delineation*, or the *plane of the picture* extended to infinity; and, second, the *vanishing point* of the original line, or the *vanishing line* of the original plane (that is, the point or line where the plane of delineation is cut by a line or plane passing through the eye parallel to the original line or plane). An original line is represented by some portion of the line from its intersecting point to its vanishing point; and every line in a given original plane has its intersecting point on the intersecting line and its vanishing point on the vanishing line of that plane. It is also proper to consider the *directing plane*, or plane through the eye parallel to the picture, the *directing line*, or line in which the directing plane cuts an original plane; the *directing point*, or point in which the directing plane is pierced by an original line; and the *director*, or line from the eye to a directing point. It is further necessary to take account of the *direct radial*, or *principal visual ray*, being the perpendicular let fall from the eye upon the plane of delineation; the *center of the picture*, or *center of vision* (called by old writers the *point of sight*), being the foot of that perpendicular; and the *principal distance*, or *distance of the picture*, being the perpendicular distance of the plane of delineation from the eye. The *ground-plane* is the level plane on which the spectator is supposed to stand. The *horizontal line*, or *horizon*, is the line in which the level plane through the eye cuts the picture, passing ordinarily through the *center of vision*. This would better be termed the *horizontal line at infinity*, for, owing to the dip of the horizon (which see, under *dip*), it differs sensibly from the delineation of the true horizon. Linear perspective is merely a branch of descriptive geometry, itself an application of projective geometry. Perspective is intimately connected with the arts of design, and is particularly necessary in the art of painting, as without a correct observance of perspective no picture can have truth. Perspective is illustrated in the correct delineation of even the simplest positions of objects.

4. A drawing or representation in perspective; specifically, a painting so placed at the end of an alley, a garden, or the like, as to present the appearance of continuing it, and thus produce the impression of greater length or extent. Stage scenic painting is of this nature.

See *gauche*.—**In perspective**, according to the laws of perspective; hence, represented on a flat surface in such a way as to convey the idea of solidity and distance.—**Inverse perspective**, the art of interpreting pictures in perspective so as to ascertain the proper position of the eye and the relative positions and forms of the objects represented.—**Isometric perspective**. See *isometric*.

It is also called *plane of projection*, *plane of the picture*, *picture-plane*.—**Projected perspective**, a modification of ordinary perspective in which the picture is further from the eye than the original objects.

=*Syn.* *Opinion*, *Belief*, *Persuasion*, *Conviction*, and *Faith* agree in expressing the assent of the mind. *Opinion* has the least feeling or energy, is most intellectual. *Belief* may be purely intellectual, or largely moral by the consent of the feelings or the will. *Persuasion* is a word borrowed from the field of action; primarily, we *persuade* one to do something by motives addressed to his feelings or interests; when the word is applied to opinions, it seems to retain much of its original sense, suggesting that the *persuasion* is founded largely on the feelings or wishes: we have a *persuasion* of that which we are willing to believe. *Conviction* starts from the other side, primarily suggesting that one was rather reluctantly forced to believe by the weight of evidence; it is now more often used of settled, profound, and earnest beliefs: as, his deepest *convictions* of right and duty. *Faith* rests upon belief, but implies confidence in a person on whose authority one depends at least partly; and the gathering of feeling about the opinion held; it is a confident *belief*: as, to have implicit *faith* in a friend or a promise. See *Difference*, and quotation from Wordsworth under definition 2.

Opinion in good men is but knowledge in the making. *Milton, Areopagitica*, 46.

Belief is regarded . . . as the recognition by conscience of moral truth. *Locky, Rationalism*, I. 191.

Conviction and *persuasion* are commonly used as synonymous terms; or, if any difference be made between them, it lies in this, that *conviction* denotes the beginning, and *persuasion* the continuance, of assent: for we are said to be convinced when brought by fresh evidence to the belief of a proposition we did not hold for truth before, but remain persuaded of what we have formerly seen sufficient grounds to gain our credit.

4. In *astron.*, a deviation of the motion of a planet or comet from a fixed orbit or from its regular velocity in that orbit. Perturbations are caused by the gravitating action of bodies other than the primary or central body. They are commonly and conveniently conceived, not as drawing the planets out of their orbits, but as causing in gradual changes of the elements of the orbits themselves. All perturbations due to gravitation are, strictly speaking, periodical. But

some of them, which depend upon the relative situation of the orbits of different planets, go through their changes in such vast intervals of time that they are more conveniently regarded as progressive and not periodic, and are termed *secular perturbations*; while others, depending for the most part upon the relative situations of the planets in their orbits, go through their changes in comparatively short intervals of time, and can only be represented as periodic, and these are technically called the *periodic equalities*. = *Syn*. 1. perturbatory (pér-tér-bá-tó-ri), *n.* [*L. perturbatio* + *-ory*.] A name once used by real and pretended believers in the divining-rod to indicate a hypothetical power assumed to reside in certain individuals whereby they can exert a perturbing influence upon the motion of a swinging pendulum, etc. Its characteristics were an expansive quality, residing most abundantly in the thumb and forefinger, whereby the center of gravity of a pendulum held by these digits would be caused to describe a circle, and a compressive quality, belonging to the middle finger, which resists such motion. A man with a high compressive or "active" perturbatory, touching with his middle finger the hand of another with the expansive perturbatory well developed in thumb and forefinger, might neutralize the perturbatory in the latter, which is of the "passive" variety. A person equally endowed with these perturbatories would be negative, and so forth.

The passive *perturbatory* is a high degree of expansive, and the active *perturbatory* in like manner a powerful compressive.

The formation looks unusual, but it is well supported by similar formations now obsolete, e.g. *peract*, *perplant*, *perstand*, etc. The sense is exactly that of *perwise*, 'look through,' and it has been supposed to be a reduction of that form; but such reduction is impossible, and *perwise* has been found only in one doubtful instance, seventy years later than the first instance of *peruse*.] 1. Pervase, *Froward*, wilful, mulish. The derivations of *pervase* and *froward* suggest essentially the same idea. *Froward*, however, has reference only to one's attitude in regard to obedience and chiefly, therefore, to the behavior of children: in *Shakespeare*, of women. It is not used of a disobedient spirit toward civil law, and *pervase* is only indirectly so used. *Pervase* has reference to one's attitude, in both conduct and opinion. The *perverse* person is settled in habit and disposition of contrariness; he not only likes or dislikes, acts or refuses to act, by the rule of contradiction to the wisdom, commands, or opinions of others, especially of those whom he ought to consider, but he is likely even to take pains to do or say that which he knows to be offensive or painful to them. *Pervarsity* may be found in a child, but it is so settled an element of character as to be rather the mark of an adult. petrography (pet-rō-gra-fī), *n.* [= *F. pétrographie*, *< Gr. πέτρα, a rock, πέτρος, a stone, + γραφία, < γράφειν, write*]. 1. The art of writing or inscribing on stone. 2. The study of rocks; lithology; petrology. The investigation of the minerals of which rocks are made, and which includes not only the determination of the mineral constituents of a rock, but also the study of the changes which these constituent minerals have undergone, either during the consolidation of the rock or at a subsequent period, in the course of those changes which are denominated *metamorphism* (see *metamorphism*)—changes often complicated and difficult to decipher. While in some rocks the constituents are crystallized in large and distinctly formed individuals, so that each species can be separated and analyzed by itself without difficulty, this is ordinarily not the case. Hence by the methods formerly pursued it was often extremely difficult, if it were possible, to make out clearly of what species the rock was composed. At the present time the method of examination of a rock consists in cutting from it one or more sections sufficiently thin to be nearly transparent; these are examined with the microscope, with and without the use of polarized light; and the optical and crystallographic appearances presented are generally sufficient to give not only a correct idea of the nature of the minerals, but also of the changes which they have undergone through various stages of metamorphism. Assistance is also afforded by the method of separation in which gravity-solutions are employed. (See *gravity-solution*.) While most geologists writing in English use the terms *lithology*, *petrology*, and *petrography* as nearly synonymous, others desire to limit the meaning of the first of these to the indoor or laboratory study of rocks, and would define *petrography* as including their investigation both indoors and in the field.

Petrology I define as that branch of science which embraces both lithology and petrology. It includes everything that pertains to the origin, formation, occurrence, alteration, history, relations, structure, and classification of rocks as such. It is the essential union of field and laboratory study. *M. E. Wadsworth, Lithological Studies, p. 2.*

When purified and deodorized, it forms a salvy neutral mass, yellow or reddish in color, odorless, tasteless, and somewhat fluorescent. It is used as a basis for ointments and as a protective dressing. Also called *vaseline* and *cosmoline*.

petroleum (pē-trō-lē-um), *n.* [= *F. pétrole* = *Sp. petróleo* = *Pg. petróleo* = *It. petrolio* = *D. G. Dan. Sw. petroleum* (MD. *petroler*), *< ML. petrolem* (also *petroleum, petroleon*, *< MGr. NGr. πετρέλαιον*, rock-oil, *< L. petra < (Gr. πέτρα, rock, + oleum < (Gr. ἔλαιον), oil*: see oil). A ML. *adj. petroleus*, pertaining to rocks (neut. *petroleum, or oleum petroleum, rock-oil*), is given.] An oily substance of great economical importance, especially as a source of light, occurring naturally oozing from crevices in rocks, or floating on the surface of water, and also obtained in very large quantity in various parts of the world by boring into the rock; rock-oil. Petroleum was known to the Persians, Greeks, and Romans under the name of *naphtha*; the less liquid kind was called *sepiacretos* by the Greeks, and *bitumen* was by the Romans a generic name for all the naturally occurring hydrocarbons which are now included under the names of *asphaltum, maltha, and petroleum*. The last name was not in use in classic times. The existence of petroleum in Pennsylvania and New York has been known from almost the earliest time of the settlement of those States by Europeans, but it was not until 1859, when oil was obtained by boring at Titusville on Oil Creek, a branch of the Allegheny River, that it began to be of commercial importance. At the present time the production of crude

petroleum reaches an amount nearly equal to thirty millions of barrels a year, and the value of the exports of this article in various forms amounts to almost \$50,000,000 a year, nearly all the material exported being furnished by the oil-fields of Pennsylvania and western New York. The crude oil undergoes refining, and is put upon the market in various forms (see *kerosene, camellia, rhodene*, etc.), but much the largest part of this product has the form of an oil suitable for burning in lamps in all parts of the world. The only other oil-producing region in the world at all comparing with that of Pennsylvania and New York is at and near Baku, on the Caspian, where the existence of oil has been known from time immemorial, but where its commercial importance has only recently been realized. The exported petroleum of the United States are chiefly from rocks of Devonian age; those of Baku occur in the Tertiary. An important part of the transportation of the crude material in the United States is effected by pipes laid beneath the surface, through which the oil is forced. See *pipe-line*. Also called *coal-oil, earth-oil*.

Phalænopsis Schilleriana.

2. In *ornith.*, a genus of owls: synonymous with *Glaucidium*. *Bonaparte*, 1854.

Phalænoptilus (fal-ē-nop'ti-lus), *n.* [NL. (Ridgway, 1880), < Gr. *φάλανα*, a moth, + *πτερόν*, soft feathers, down.] A genus of fissirostral picarian birds of the family *Caprimulgidae*, or goatsuckers; the poor-wills: so called from the hoariness of the plumage, which resembles that of a moth. The type is Nuttall's poor-will, *P. nuttalli*, common in western parts of the United States.

phalangal (fā-lang'gal), *a.* Same as *phalangæal*.

[In all senses commonly in the plural *phalanges*, the usual singular being *phalanx*.]

phalangeal (fā-lan'jē-āl), *a.* [*phalange* + *-al*.] In *anat.* and *zool.*, of or pertaining to a phalanx or the phalanges. Also *phalangal*, *phalangial*, *phalangean*, *phalangian*.—**Phalangeal bone**, *phalanx*.—**Phalangeal process**. (*a*) Of Beiter's cells, a slender prolongation attached above to a phalanx of the reticular lamina of the Cortian organ. (*b*) The outwardly directed process of the head of an outer rod of Corti. Also called *phalanx* of a rod of Corti.

phalangean (fā-lan'jē-an), *a.* [*phalange* + *-an*.] Same as *phalangeal*.

phalanger (fā-lan'jēr), *n.* [*F. phalanger*, < *phalange*, *phalanx*: see *phalanx*.] **1.** A marsupial mammal of the genus *Phalanger* or *Phalangerista*, or of the subfamily *Phalangeristinae*; a phalangist: so named by Buffon (in the case of a species of *Cuscus*) from the peculiar structure of the second and third digits of the hind feet, which are webbed together. Phalangiers are opossum-like quadrupeds whence the name. They are voracious and insectivorous, represented in abundance in the whole Australian region by numerous species and several genera. They have a thick woolly coat, and average about the size of a cat, though some are much smaller. The phalangiers proper have no parachute; others, known as *petaurists*, or flying-phalangiers, are provided with a flying-membrane. Some of the best-known species belong to the genus *Cuscus*, as the urine phalanger, *C. ursinus*. Valenty's phalanger is *C. orientalis*, known also by its native names *kayuma* and *coesques*. The vulpine phalanger is *Trichosurus vulpinus*, having the tail almost entirely hairy, and combining to some extent the aspects of a squirrel and a fox. Cook's phalanger and some related forms belong to the genus *Phalanger*. Several small forms, resembling dormice, constitute the genus *Dromicia*. See cuts under *Dromicia*, *Cuscus*, *Petaurista*, and *Acrobates*.

2. [*cap.*] [NL.] A genus of phalangiers founded by Storr in 1780. The name is prior in date to *Phalangerista*, but until lately has been less used.

More fully called *Pecora Phalangigrada*. Also *Tylopoda*.

phalangigrade (fā-lan'ji-grād), *a.* [NL, *phalangigradus*, < L. *phalanx* (*phalang-*), *phalange*, + *gradus*, walk, go.] Walking on the phalanges, which are padded for that purpose instead of being incased in hoofs, as a camel or llama; or of pertaining to the *Phalangigrada*.

Phalangidae (fal-an-jī'dē), *n. pl.* [NL, < *Phalangium* + *-idae*.] The leading family of the order *Phalangida*, having a small rounded, oblong, or oval body, and extremely long slender legs with many-jointed tarsi. The legs reach the maximum of length and attenuation in this family, being sometimes more than twenty times as long as the body. The eyes are close together on the top of the head; a very long penis can be protruded from beneath the mouth; the cheliceres are exposed, diversiform, well developed, and the pedipalps are moderately long. There are many genera besides *Phalangium*. Also *Phalangidæ*.

phalangious (fā-lan'ji-us), *a.* [NL, < *Phalangium* + *-ous*.] Of or pertaining to the genus *Phalangium*.

phalangist (fal'an-jist), *n.* [NL, *Phalangista*.] A phalanger; a member of the genus *Phalangista*.

Phalangista (fal-an-jis'tā), *n.* [NL, (Cuvier, 1800), < L. *phalanx* (*phalang-*), *phalanx*: see *phalanx*.] The typical genus of *Phalangistidae*; synonymous with *Phalanger*, 2. See *phalanger*.

Phalangistidae (fal-an-jis'tī-dē), *n. pl.* [NL, < *Phalangista* + *-idae*.] 1. A family of diprotodont marsupial mammals, containing the phalangers or Australian opossums, the petaurists, the koala, etc. The family includes numerous genera and species of Australia and Papua, of small or moderate size and arboreal habits, and diversified diet. It is divisible into three subfamilies, *Phalangistinae*, *Tarsipedeinae*, and *Phascorhynchinae*. See cuts under *Acerobates*, *koala*, *Petaurista*, *Cuscus*, and *Dromedus*.

2. The above family restricted by exclusion of *Tarsipedeinae* and *Phascorhynchinae* as types of separate families.

Phalangistinae (fal'an-jis'tī-nē), *n. pl.* [NL, < *Phalangista* + *-inae*.] A subfamily of *Phalangistidae*, embracing the several genera and numerous species of true phalangers which lack the peculiarities of the genera *Tarsipis* and *Phascorhynchus*. The typical phalangers or native opossums have prehensile tails and no flying-membrane, constituting the genera *Phalangista*, *Cuscus*, *Pseudochirus*, and *Dactylopsila*. The flying-opossums, flying-squirrels, or petaurists have a parachute and non-prehensile tail, and include the genera *Petaurus*, *Balidena*, *Acerobates*, and others. The *Phalangistinae* range in size from that of a mouse to that of a cat, and are of arboreal habits; they are distributed throughout the Australian region.

phalangistine (fal'an-jis'tin), *a.* and *n. I. a.* Of or pertaining to the *Phalangistinae*.

II. *n.* A phalanger or phalangist as a member of the *Phalangistinae*.

ed and made typical of the modern family *Phalangidae*. It is characterized by the great length and slenderness of the legs, the filiform maxillary palpi simply hooked at the end, and the segmented abdomen dis-

ting from and of equal width with the cephalothorax. The species are of active habits and live on animal food.

phalanstere (fal'an-stēr), *n.* [F. *phalanstère*: see *phalanstery*.] A phalanstery. *Bulwer*, *My Novel*, IV. viii.

phalanx (fā'langks or fal'angks), *n.*; pl. *phalanges* (fā-lan'jēz) (or except in anatomy *phalanxes* (fā'langk-sez or fal'angks-sez). [= F. *phalange* = Pg. *phalange* = Sp. *falange*, < L. *phalanx* (*phalang-*), < Gr. *phalaγ* (*phalaγ-*), a line or order of battle, a rank of soldiers, a phalanx (def. 1), also a round piece of wood, the bone between joints of the fingers and toes, etc.]

1. In *Gr. antiq.*, in general, the whole of the heavy-armed infantry of an army; particularly, a single grand division of that class of troops when formed in ranks and files close and deep, with their shields joined and long spears overlapping one another so as to present a firm and serried front to a foe. The celebrated Macedonian phalanx was normally drawn up sixteen ranks deep, the men being clad in armor, bearing shields, and armed with swords and with spears from 21 to 24 feet long. In array the shields formed a continuous bulwark, and the ranks were placed at such intervals that five spears which were borne pointed forward and upward protected every man in the front rank. The phalanx on smooth ground, and with its flanks and rear adequately protected, was practically invincible; but it was cumbersome and slow in movement, and it once broken could only with great difficulty be reformed.

Of flutes and soft recorders. *Milton*, *P. L.* I. 551.

2. Any body of troops or men formed in close array, or any combination of people distinguished for firmness and solidity of union.—3. In Fourier's plan for the reorganization of society, a group of persons, numbering about 1,800, living together and holding their property in common. See *Fourierism*.—4. In *anat.* and *zool.*: (a) A row or series of bones in the fingers or toes. Hence—(b) One of the bones of the fingers or toes; a digital intertome, succeeding the metacarpal or metatarsal bones, collectively constituting the skeleton of the third and distal segment of the hand or foot: so called from their regular disposition in several rows. The normal number of the phalanges of each digit is three. This is only exceptionally increased, as in the flippers of some cetaceans and extinct reptiles; but it is frequently reduced, as in most of the digits of birds, and in the inner digits of mammals which have five fingers and toes. In man the phalanges of the fingers and toes are each fourteen, three to every digit excepting the thumb and great toe, which have two apiece. The original implication of the term seems to have been any one of the cross-rows of small bones between the successive knuckles of the fingers or toes, or the longitudinal series of small bones of any one finger or toe. But usage transfers the sense of *phalanx* to any one of these bones, two or more of which are *phalanges*. See cuts under *Artiodactyla*, *carpus*, *Catarrhina*, *foot*, *hand*, *Ichthyosauria*, *Perissodactyla*, *paw*, *Plesiosauros*, *solidungulate*, *tarsus*, and *Ornithoscelida*. (c) One of the fiddle-shaped cells of the lamina reticularis of the Cortian organ. Also called *Deiters's phalanges*.—5. In *zool.*, a group or series of animals, of indeterminate classificatory value; one of several groups which may be interposed above genera and below classes or orders. A phalanx frequently corresponds in value to a subfamily, but has no recognized fixed place in classification. Sometimes synonymous with *cohort* or *army*.—Basilar *phalanx*, a phalanx of the proximal row.—Middle *phalanx*, a phalanx of the middle row.—Ungual *phalanx*, the terminal phalanx, on which is the nail.

There are 3 species, usually placed in as many genera, of elegant and varied coloration, and in general resembling sandpipers; but the body is depressed rather than compressed, and the plumage of the under parts is thick and compact to resist water, upon which these little birds swim with great ease and grace. They are found on inland waters and along the coasts of most parts of the world, sometimes venturing far out to sea. Two of the three species breed only in boreal regions, and perform extensive migrations in the spring and fall. Wilson's phalarope, *Phalaropus (Steganopus) wilsoni*, the largest and handsomest species, is confined to America, breeding from northern parts of the United States northward, and dispersing in winter over South America. It is 8½ inches long, and 1½ in extent of wings; the bill is 1½ inches long and extremely slender; the margins of the toes are not scalloped. The female exceeds the male in size and beauty, and the male performs the task of incubation. The red-necked or northern phalarope is *Phalaropus (Lobipes) hyperboreus*; this has a slender bill like the first, but is smaller, and the membrane
